Executive Summary

Content

This report is an update to the December 2022, and April 2024 study iterations previously prepared. This addresses review comments following the most recent development application submission. Specifically, horizon years for assessment and further investigation regarding auxiliary turn lanes at the site access.

This study has been prepared in support of a proposed residential development for a site located at the municipal address of 12148 Albion Vaughan Road in the community of Bolton, Town of Caledon, Region of Peel.

The development as proposed consists of two residential towers, one six-storey tower and one seven-storey tower. In total the overall development proposes a total of 264 residential dwelling units. A total of 468 parking spaces would be provided on-site to serve the development. Vehicular access would be provided via full-movement driveway connections with Albion Vaughan Road. A total of 86 bicycle parking spaces will also serve the development (56 long-term and 30 short-term spaces).

The study assesses the weekday AM and PM peak hour traffic impact of the proposed development, provides a review of the parking requirements, and a functional review of the proposed site plan.

Conclusions

The conclusions of the study are as follows:

- ▶ Under the base year conditions, all study area intersections operate at acceptable levels of service and within capacity.
- ▶ For the 2032 background traffic conditions (without subject development), all study area intersections are forecast to operate at acceptable levels of service and within capacity.

The exception would be the Regional Road 50 and Albion Vaughan Road/Mayfield Road intersection, where the overall intersection v/c ratio is forecast to be 0.98 during the AM peak hour. The southbound dual through movement is reported to operate with a v/c of 0.97 during the AM peak hour.

- ▶ Under the 2032 total traffic conditions (with subject development), all study area intersections are forecast to operate at acceptable levels of service and within capacity.

The previously identified critical movements would continue to be reported, albeit slightly exacerbated, with the addition of the westbound left turn movement identified under the AM peak hour.

- ▶ The overall impact of the proposed residential development is anticipated to be minimal. The development is estimated to generate and add a total of 105 and 104 vehicle trips to the adjacent transportation network during the AM and PM peak hours, respectively.

The additional traffic would be less than daily traffic variations typically experienced. It is determined the site generated traffic would increase volumes at the study area intersections between 0.9 to 2.2%;

- ▶ To mitigate identified critical movements under total traffic conditions, the planned road widening of Albion-Vaughan Road, and auxiliary dual left-turn lanes were investigated at the westbound approach at the intersection of Regional Road 50 and Albion Vaughan Road/Mayfield Road intersection.

As analyzed with the planned road widening, and dual left-turn lanes on the westbound approach and optimization of signal timing splits within exiting cycle lengths, the overall intersection is reported to operate at acceptable levels of service and with all movements within capacity under the 2032 horizon.

- ▶ At the main central site access intersection with Albion Vaughan Road, it was determined an auxiliary northbound left-turn lane would be warranted from a volume perspective for the future four-lane cross-section of Albion-Vaughan Road;
- ▶ The proposed vehicular parking supply satisfies the minimum zoning by-law requirements.
- ▶ A review of the site plan was undertaken. No major conflicts or issues were identified for the anticipated design vehicles expected on-site.

Recommendations

The recommendations of the study are as follows:

- ▶ From a transportation perspective, the planning applications sought should be approved as the development is determined to have a minimal impact on the adjacent transportation network;
- ▶ Provision of a northbound left-turn lane on Albion-Vaughan Road to serve the site's central access;

- ▶ The Town of Caledon to provide the planned widening Albion-Vaughan Road to four-lanes by 2031 as identified within the Multi-Modal Transportation Master Plan; and
- ▶ The intersection volumes and operations at the Regional Road 50 and Albion Vaughan Road/Mayfield Road intersection be monitored by the applicable jurisdiction to determine when dual westbound left-turn lanes should be provided.

1 Introduction

1.1 Overview

This report is an update to the December 2022, and April 2024 study iterations which were updates to the original November 2020 study prepared. This addresses review comments following the most recent development application submission. Specifically, horizon years for assessment and further investigation regarding auxiliary turn lanes at the site access.

Paradigm Transportation Solutions Limited (Paradigm) was retained to conduct this Traffic Impact and Parking Study for a proposed residential development in the community of Bolton (Town of Caledon). **Figure 1.1** illustrates the location of the subject site situated on the west side of Albion Vaughan Road, north of Regional Road 50.

1.2 Purpose and Scope

The purpose of this report is to identify and assess the potential traffic impacts of the proposed development. The scope of the study was originally developed in consultation with Town of Caledon staff via e-mail correspondence in October 2020.

The study has been updated based on review comments received from Town of Caledon staff to date. At the time of writing of the original study, Region of Peel staff had not responded to our request for pre-study consultation. It is further noted that following the initial and second development application submissions, Region of Peel staff did not have any review comments on the transportation study deliverable. **Appendix A** contains the original terms of reference and pre-study consultation completed with Town staff.

The scope of this study is as follows:

- ▶ A study area comprising the following intersections:
 - Peel Regional Road 50 and Albion Vaughan Road/Mayfield Road;
 - Albion Vaughan Road and Kirby Road; and
 - Albion Vaughan Road and the proposed central site access driveway.
- ▶ Traffic forecasts for 2032, representing a five-year horizon following anticipated build-out/occupancy in 2027;
- ▶ Weekday AM and PM peak hour analysis time periods;

- ▶ A review of parking to confirm the proposed supply will be adequate for the proposed use; and
- ▶ A review of the design of site accesses, internal circulation, and loading areas to confirm they will accommodate the vehicles expected on-site.

The methodology used in this study is summarized below:

- ▶ Estimate the future peak hour background traffic for the horizon year by applying a 2% per annum growth rate as advised by Town staff;
- ▶ Estimate the net increase in vehicular traffic with the proposed development;
- ▶ Combine the future background traffic with the net increase in site traffic to determine the total traffic volumes under the horizon year;
- ▶ Analyze existing, future background, and total traffic conditions;
- ▶ Determine the net impact on operational performance due to site traffic, and the need for road and/or traffic control improvements to address the identified impacts; and
- ▶ Use of AutoTURN software to prepare on-site vehicle maneuvering diagrams.

This study has been carried out in general accordance with the Region's TIS Guidelines¹, pre-study consultation comments and addressed review comments received from Town staff. **Appendix A** contains the pre-study correspondence and comments.

Study Area and Site Location

12148 Albion Vaughan Road – Traffic Impact and Parking Study
200185

Figure 1.1

2 Proposed Development

The subject site is located at the municipal address of 12148 Albion Vaughan Road. The subject lands are currently occupied by a detached single-family home which would be demolished to facilitate redevelopment of the lands.

Figure 2.1 illustrates the site plan. The proposed residential development consists of two residential towers. In total the overall development proposes a total of 264 residential dwelling units. The development statistics are as follows:

- ▶ One six-storey residential tower with 114 units total:
 - 37 one-bedroom units;
 - 22 one-bedroom + den units;
 - 31 two-bedroom units;
 - 18 two-bedroom + large balcony units;
 - 6 three-bedroom units.
- ▶ One seven-storey residential tower with 150 units total:
 - 40 one-bedroom units;
 - 14 one-bedroom + den units;
 - 68 two-bedroom units;
 - 21 two-bedroom + large balcony units;
 - 7 three-bedroom units.

The entire development would be served by several at-grade parking spaces and a two-level underground parking structure. A total parking supply of 468 spaces serving residents and visitors are proposed on-site.

A total of 86 bicycle parking spaces (30 short-term and 56 long-term) are proposed on-site. All 30 short-term spaces are proposed at-grade. All 56 long-term bicycle parking spaces are located within secured storage rooms in the underground structure serving residents.

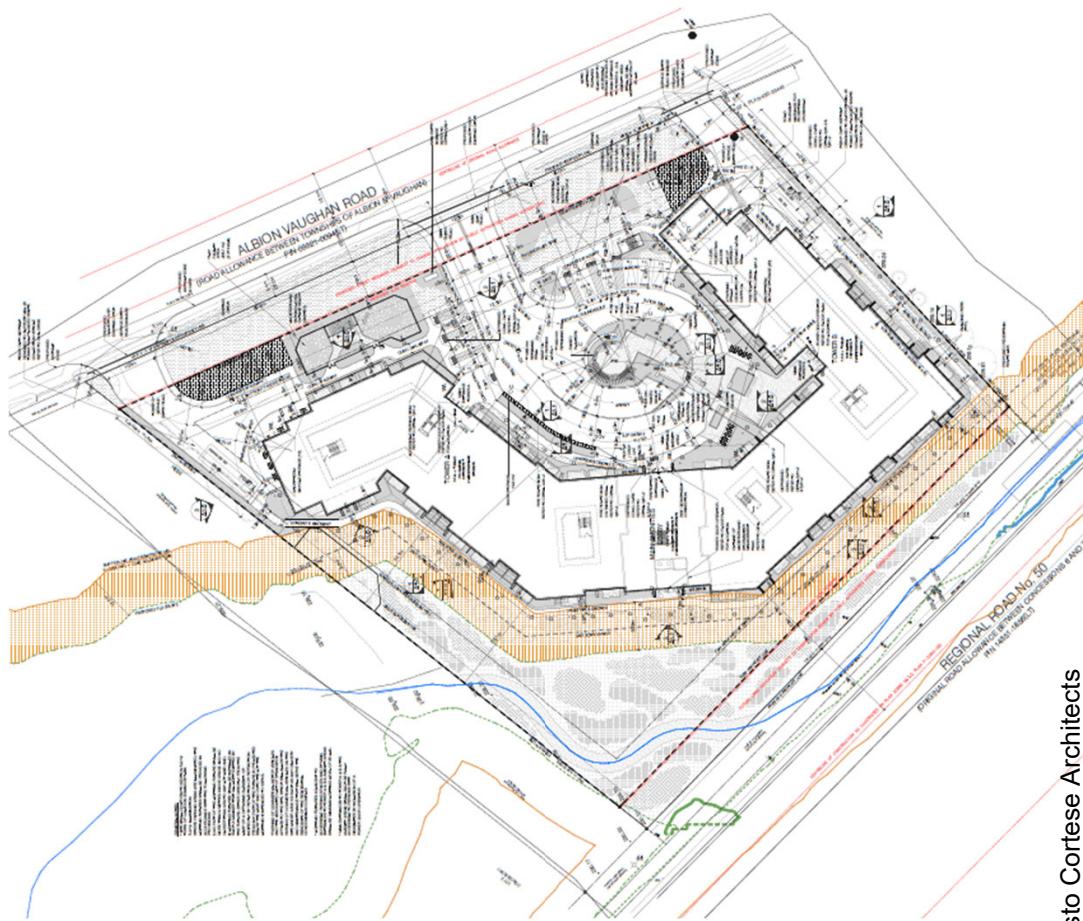

Three full-movement access driveways are proposed, with two of the three driveways providing dedicated access to the loading area serving each residential tower (i.e., service vehicles only). The main central vehicular access serving the development provides access for building residents and visitors.

Site Plan

200185

3 Existing Conditions

3.1 Roads and Traffic Control

The characteristics of the roads and intersections in the vicinity of the subject site are described below. Reference is made to the Town of Caledon's Official Plan – Schedule J: Long Range Road Network². The main roadways that form the study area comprise Albion Vaughan Road-Mayfield Road, Regional Road 50, and Kirby Road. Each roadway is described as follows:

- ▶ **Albion Vaughan Road** is a north-south, two-lane, undivided roadway that operates under the jurisdiction of the Town of Caledon. The road is classified as a medium capacity arterial per the Town's Official Plan, additionally this roadway is identified as the Proposed Bolton Arterial Route (BAR). The roadway has a rural cross section, with gravel shoulders on both sides. The posted maximum speed limit is 60 km/h within the study area limits;
- ▶ **Mayfield Road (Peel Regional Road 14)** is an east-west, two-lane, undivided roadway that operates under the jurisdiction of the Regional Municipality of Peel. The road is classified as a major road under the Region's Official Plan and a high capacity arterial per the Town's Official Plan. The roadway has a semi-urban cross section. The posted maximum speed limit is 60 km/h within the study area limits;
- ▶ **Highway 50 (Peel Regional Road 50)** is a north-south four-lane undivided roadway that operates under the jurisdiction of the Regional Municipality of Peel. The road is classified as a major road under the Region's Official Plan³ and a high capacity arterial per the Town's Official Plan. The roadway has an urban cross section north of Albion Vaughan Road/Mayfield Road, and a semi-urban cross section south of Albion Vaughan Road/Mayfield Road. The posted maximum speed limit is 80 km/h within the study area limits;
- ▶ The intersection of Regional Road 50/Albion Vaughan Road-Mayfield Road is currently signalized with auxiliary left and right turn lanes are provided on each intersection approach; and

² Town of Caledon, *Official Plan, Schedule J – Long Range Road Network*, April 2018.

³ Regional Municipality of Peel, *Official Plan, Schedule F-2 – Major Road Network*, April 2022.

- ▶ The intersection of Albion Vaughan Road/Kirby Road forms an unsignalized “T” intersection. Stop control is provided on the westbound Kirby Road approach.

Figure 3.1 illustrates the existing lane configurations and traffic control devices at the study area intersections.

Existing Lane Configurations and Traffic Control

12148 Albion Vaughan Road – Traffic Impact and Parking Study
200185

Figure 3.1

3.2 Transit Services

The study area is currently served by limited transit routes/services.

Within the community of Bolton, Brampton Transit currently provides transit services, replacing Voyago which has been serving the community since 2019.

Brampton Transit Route 41 – Bolton operates and serves the same route previously provided under Voyago. That is, transit services along Regional Road 50, operating between Columbia Way/Regional Road 50 and the transit station at Queen Street/Highway 7 in Brampton. At this transit station, riders have the opportunity to connect with other Brampton Transit routes, Mississauga Transit (MiWay), and York Region Transit (YRT and VIVA) routes. In addition, this transit route now provides a loop servicing a segment of Coleraine Drive.

GO Transit provides bus service to the Regional Road 50/Mayfield Road Park and Ride located on the southwest corner of the intersection of Regional Road 50 and Albion Vaughan Road/Mayfield Road. The following route is operated by GO Transit:

- ▶ **Route 38 (Bolton)** operates between Downtown Bolton and Malton GO Station, also stopping at Union Station in Toronto. Service is provided Monday to Friday only.

3.3 Active Transportation

Sidewalk and separated bicycle infrastructure is not provided on Regional Road 50 or along Albion Vaughan Road. Pedestrians and cyclists are expected to utilize the gravel shoulder on either roadway or share the travelled roadways with vehicles.

A review of the Region of Peel's Active Transportation Implementation Plan⁴ did not identify any existing cycling or pedestrian facilities on the study area roadways. The Long-Term Regional Pedestrian Network (Caledon) proposes sidewalks on the west and east sides of Regional Road 50; however, no horizon year for their implementation is currently known.

The Proposed Long-Term Regional Cycling Network (Caledon) proposes bike lanes on Regional Road 50; however, no horizon year for their implementation is currently known as well. Further review of the Town of Caledon's Active Transportation Master Plan⁵, specifically

⁴ Regional Municipality of Peel, *Active Transportation Implementation Plan 2018-2022*.

⁵ Town of Caledon, *Active Transportation Master Plan*, Map 5 Network Recommendations, June 2024

Map 5 – Network Recommendations, identifies provision of cycling a Multi-Use Path along Albion Vaughan Road.

Review of the Town of Caledon's Multi-Modal Transportation Master Plan⁶, Figure 7-4 identified the proposed active transportation facility along Albion-Vaughan Road as "Physically Separated".

The walk phases incorporated into the signal timing plan for the Regional Road 50 and Albion Vaughan Road/Mayfield Road intersection are push button actuated for pedestrians to cross Regional Road 50. The pedestrian phase is always provided for both the northbound and southbound through phases. Pedestrian signal heads are provided for each approach crossing. The existing volume of crossing pedestrians at this intersection during the weekday AM and PM peak hours was found to have zero pedestrian crossings.

3.4 Modal Split

To gain a better understanding of existing travel characteristics of the subject site and surrounding area, 2016 Transportation Tomorrow Survey (TTS) data was reviewed for TTS Zone 3190. Zone 3190 is bounded by Queensgate Boulevard, Regional Road 50, and Albion Vaughan Road.

It is noted the extracted TTS information is solely to understand travel characteristics. The modal split data has not been applied to any trip generation estimates within this assessment.

The existing mode share for travel during the weekday AM and PM peak periods has been reviewed. Inbound and outbound trips during the morning three-hour travel period (6:00 AM – 9:00 AM) and the afternoon three-hour travel period (4:00 PM – 7:00 PM) were assessed.

Table 3.1 summarizes the existing modal splits. **Appendix C** contains the TTS data for reference.

⁶ Town of Caledon, *Multi-Modal Transportation Master Plan*, Figure 7-4 Proposed Active Transportation Network, June 2024

TABLE 3.1: EXISTING MODAL SPLIT

Mode	AM Inbound	AM Outbound	PM Inbound	PM Outbound
Auto Driver	84%	76%	88%	85%
Auto Passenger	6%	13%	9%	14%
Transit	0%	2%	2%	0%
Cycle	0%	0%	0%	0%
Walk	10%	9%	1%	1%
Total	100%	100%	100%	100%

Inbound and outbound trips during the AM peak period are predominately automobile based accounting for 90% of trips, whereas 10% of the trips are made via walking. This relatively high percentage of walking trips appears to be attributed to school-related trips.

Similarly, PM peak period trips are predominantly automobile based. Automobile trips account for 97% of PM inbound trips and 99% of PM outbound trips.

3.5 Traffic Volumes

Turning movement counts (TMC) quantify the volume and type of vehicles travelling through an intersection. The TMC data is typically collected during peak travel periods to capture peak traffic volumes and patterns.

Beginning in March 2020 the Province of Ontario implemented restrictions for day-to-day activities in response to the COVID-19 global pandemic. Restrictions included the closure of all school institutions under further notice, reduced gathering sizes which has results in limited operations at places of employment. At the time of writing, restrictions were in place to varying degree. As a result, typical travel volumes and travel patterns have been impacted and the collection of turning movement counts would not reflect typical volume conditions within the study area.

For the purposes of this report, Paradigm has referenced historical turning movement counts completed by Traffic Survey Analysis (TSA). TSA completed eight-hour turning movement counts at both intersections on Thursday November 24, 2016. These counts have been factored to a 2022 base year condition by applying a 2.0% compounded per annum growth rate to through movements only as per Town staff review comments. The use of historical data and the growth rate were previously signed-off on by Town staff during pre-study consultation.

Historical traffic volume data (2009 to 2017) along Regional Road 50 and Mayfield Road were reviewed to verify the use of the 2.0% growth

rate on the Regional roads. The data was obtained from Region of Peel OpenData Portal⁷.

On Regional Road 50, the data indicates a growth rate of 1.1% and -0.1% north and south of Albion Vaughan Road/Mayfield Road, respectively, whereas, the Mayfield Road data indicates a growth rate of 0.4%. A conservative approach (i.e., errs on the high side) was adopted by using the same 2.0% compounded per annum growth rate. **Appendix B** contains historical data extracted and growth rate calculations for reference.

The 2016 traffic counts at Regional Road 50 and Albion Vaughan Road/Mayfield Road were completed from 6:00 AM to 10:00 AM, and 2:00 PM to 6:00 PM. The counts at Albion Vaughan Road and Kirby Road were completed from 6:00 AM to 9:00 AM, 11:30 AM to 1:30 PM, and from 3:00 PM to 6:00 PM. All traffic movements, including pedestrian crossings were counted in 15-minute intervals and vehicles were classified by type.

Figure 3.2 illustrates the base year (2022) traffic volumes. **Appendix C** contains the raw count data for reference.

3.6 Traffic Observations

Based upon notes and observations conducted when the traffic counts were collected in November 2016, it was noted that a good level of service was generally provided in the study area.

The exception being that the westbound left-turn movement on Albion Vaughan Road at Regional Road 50 was observed to experience a high level of delay in the AM peak hour.

This observation is further validated by the high volume of vehicles performing the movement. The raw unadjusted 2016 counts recorded 491 vehicles performing this movement exceeding 300 vehicles per hour during the AM peak hour, which is the threshold where both the Highway Capacity Manual and the Transportation Association of Canada Geometric Design Guide for Canadian Roads recommend the consideration of dual left-turn lanes.

Detailed notes from the observations conducted are summarized below:

- ▶ Vehicle operations were observed to be operating well, with good traffic flow noted through the intersection. All movements

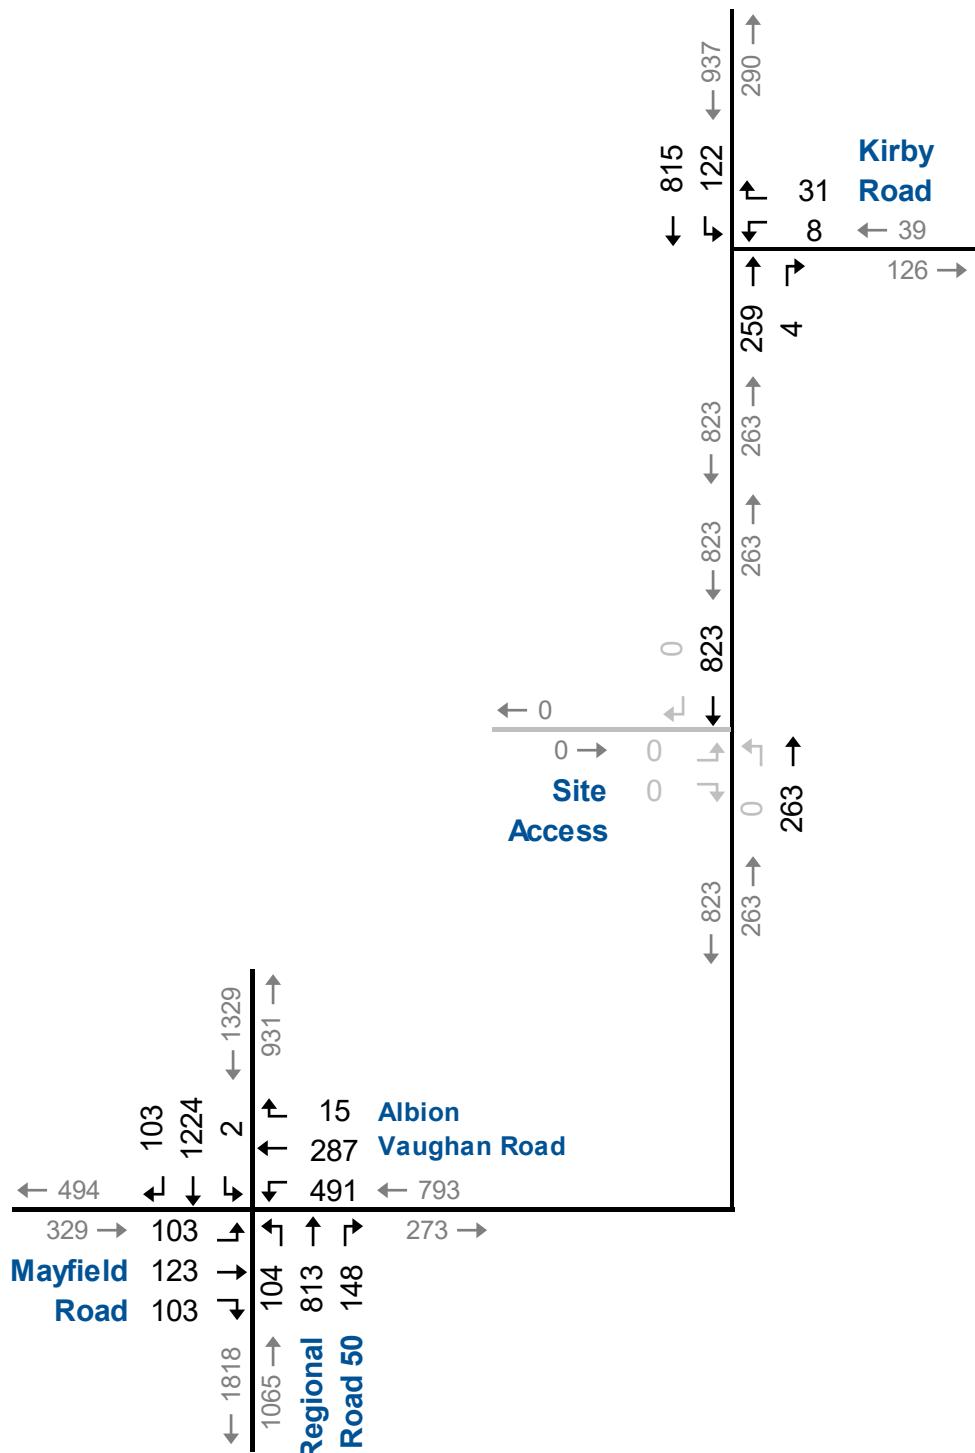

⁷ https://data.peelregion.ca/datasets/844846e93de64ddd910c2b6e964105f1_0/explore?location=43.846124%2C-79.693155%2C16.21

were noted to be within capacity, with the exception of the westbound left turn movement during the AM peak period;

- ▶ Vehicles were processed through the intersection efficiently. No intersection breakdown or capacity issues were observed during AM peak period;
- ▶ Traffic movements along the major roadway (i.e., Highway 50) were flowing well, and as expected the crossroads of Albion-Vaughan Road/Mayfield Road incurred slightly higher delays due; however, were operating acceptably;
- ▶ Motorists were observed to be attentive and efficient (i.e., little to no lost time); and
- ▶ Vehicular queues were observed to be contained within their provided storage, not obstructing or blocking adjacent through travel lanes.

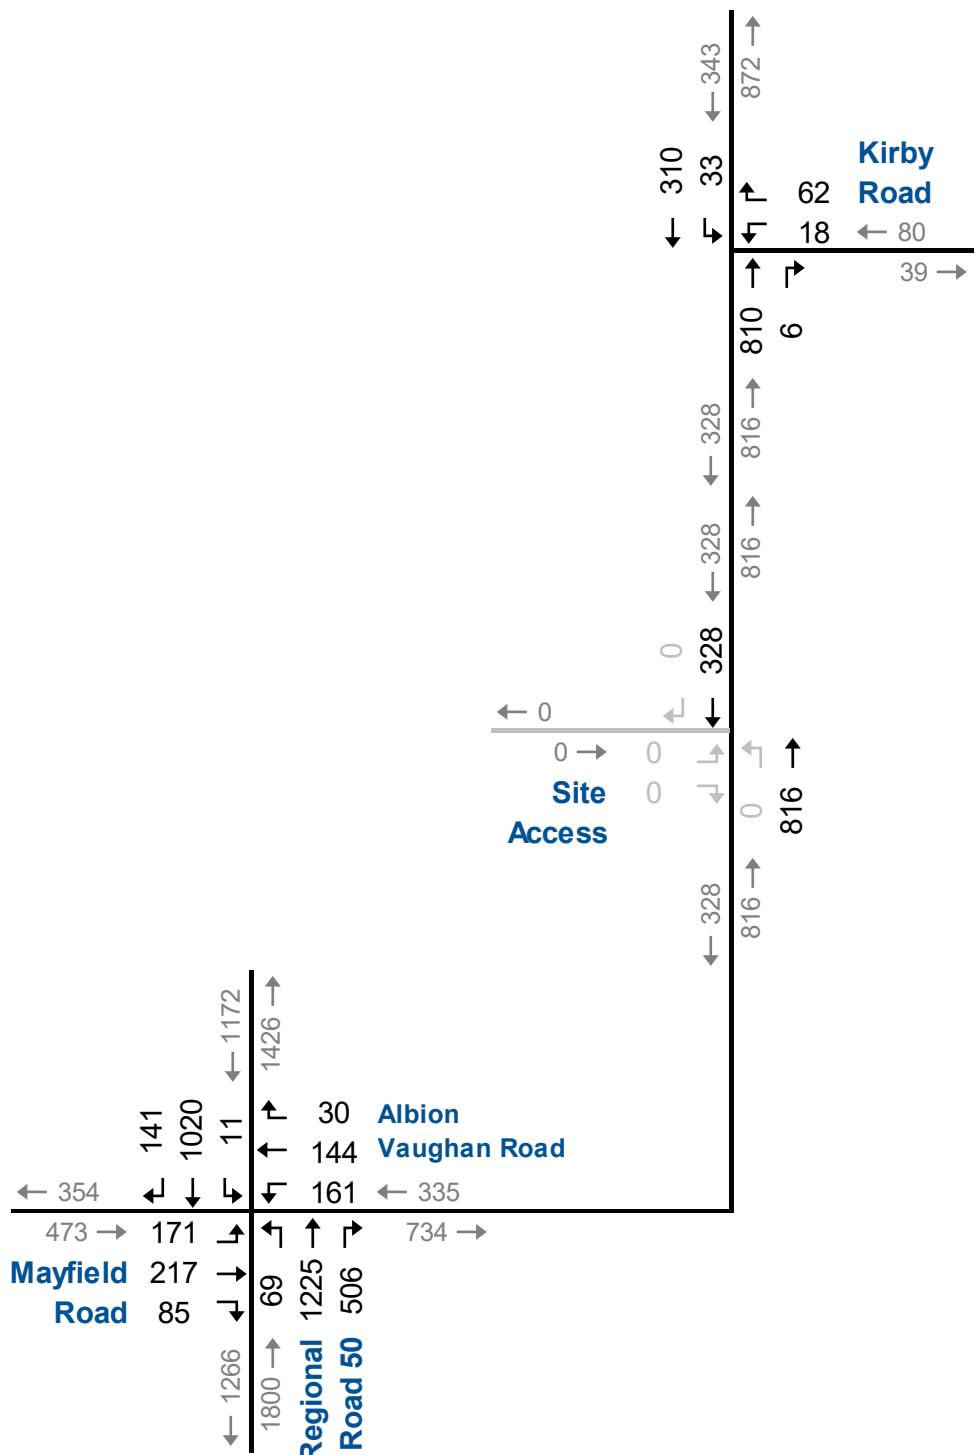

Base Year Traffic Volumes AM Peak Hour

12148 Albion Vaughan Road – Traffic Impact and Parking Study
200185

Figure 3.2A

3.7 Traffic Operations

Intersection Level of Service (LOS) is a recognized method of quantifying the efficiency of traffic flow at intersections and is based on the delay experienced by individual vehicles executing the various movements. The delay is related to the number of vehicles desiring to make a movement, compared to the estimated capacity for that movement. The capacity is based on several criteria related to opposing traffic flows, and at signalized intersections, signal timing. Capacity is evaluated in terms of the ratio of demand flow to capacity with an at-capacity condition represented by a volume-to-capacity (v/c) ratio of 1.00 (i.e., volume demand equals capacity).

The highest possible rating is LOS A, under which the average total delay at signalized and unsignalized intersections is equal or less than 10 seconds per vehicle. When the average delay for a movement exceeds 80 seconds at signalized intersections, or 50 seconds at unsignalized intersections, the movement is classified as LOS F, and remedial measures are usually implemented, if they are feasible.

To adhere to the Region of Peel guidelines for operational analysis⁸, the following criteria have been used for the determination of the need for capacity or traffic control improvements to the study area intersections.

- ▶ When v/c ratios for overall intersection operations, through movements, or shared through/turning movements exceeds 0.90;
- ▶ When v/c ratios for dedicated turning movements exceeds 1.00; and/or
- ▶ When 95th percentile queue lengths for individual movements exceeds available lane storage.

To assess the base year traffic operating conditions, a level of service analysis has been conducted using Synchro software, which implements the methods of the Highway Capacity Manual (HCM). The following parameters have been utilized in the analysis:

- ▶ Existing lane configurations;
- ▶ Signal timing as provided by the Region (and included in **Appendix C** for reference);
- ▶ Heavy vehicles percentages and crossing pedestrian volumes as extracted from the turning movement counts;

⁸ Regional Municipality of Peel, *Traffic Impact Study Guidelines*, Accessed 9 November 2020 from <https://www.peelregion.ca/pwl/transportation/business/traffic-impact-study.asp>

- ▶ Lane widths as per “Regional Guidelines for Using Synchro”⁹;
- ▶ Peak hour factors of 1.00 as per “Regional Guidelines for Using Synchro”¹⁰; and
- ▶ Synchro default values for all other inputs.

Table 3.2 presents the operational analysis results including the level of service (LOS), average delay in seconds, volume to capacity (v/c) ratio, and 95th percentile queue length in metres. Any critical movements are highlighted in yellow.

Appendix D contains the Synchro analysis outputs for reference.

In summary, the base year operations represent acceptable levels of service. All traffic movements are currently found to operate acceptably and within capacity.

It is noted the westbound left turn movement is approaching capacity under base year traffic conditions.

The 95th percentile queue lengths were checked for all turn lanes against provided storage, and queue lengths for through movements were also checked. It was confirmed no spillback issues are present.

4 Future Traffic Conditions

4.1 Horizon Year

Traffic forecasts have been developed for the horizon year of 2032 representing a period five-years from the anticipated build-out/occupancy of the site.

4.2 Forecast Background Traffic

The future background traffic volumes in the study area are expected to comprise general background growth and specific traffic generated by approved or in-stream developments.

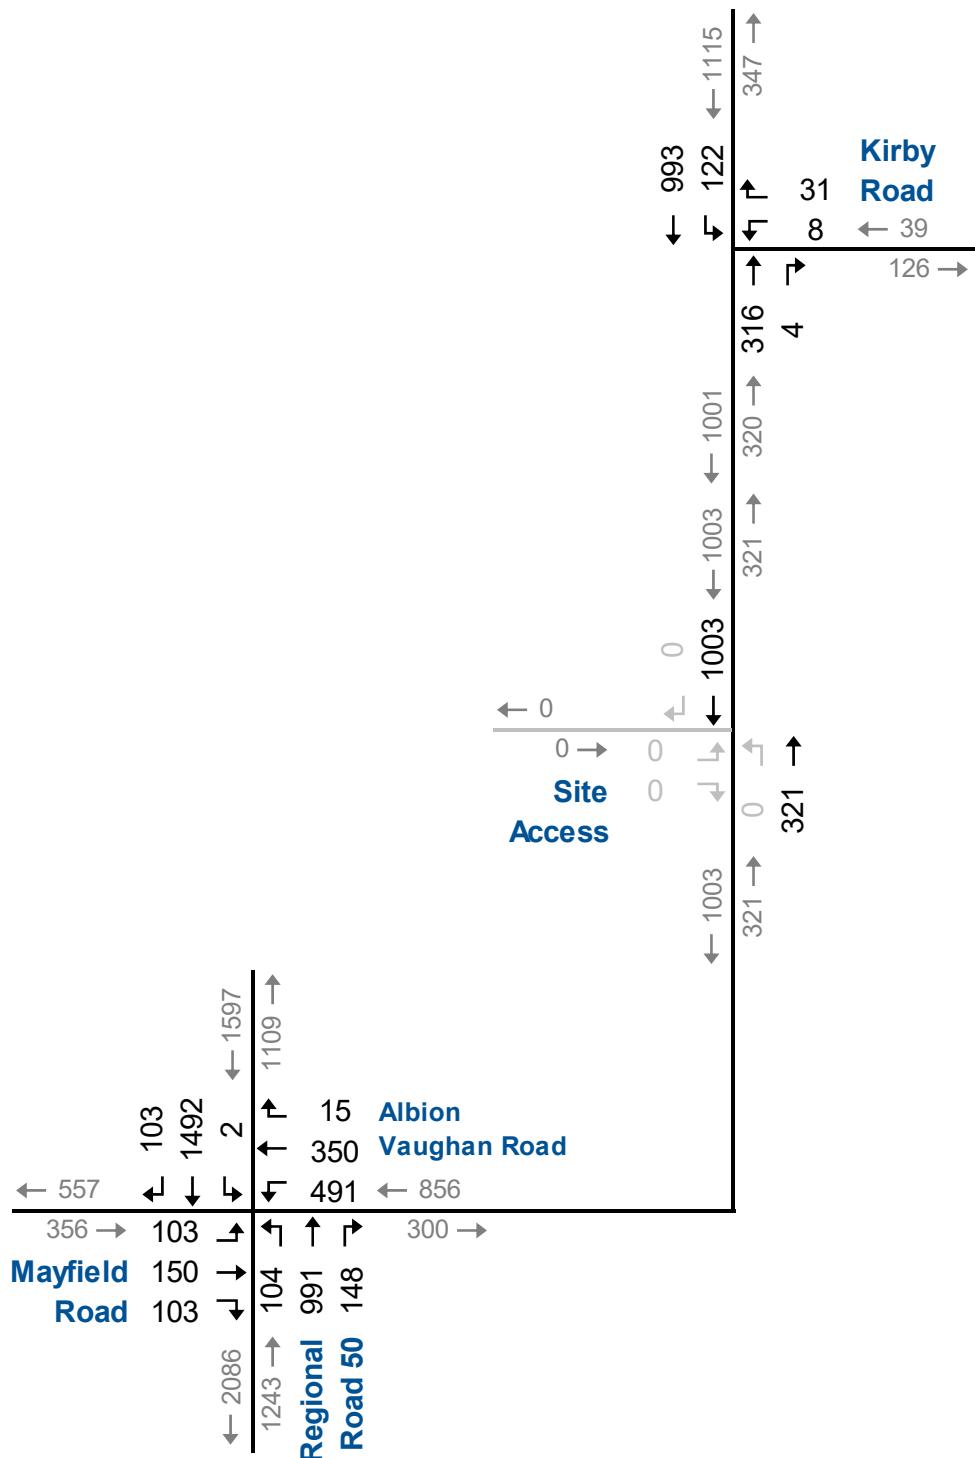

During pre-study consultation, Town staff advised the use of a 2.0% compounded per annum growth rate for application on roadways under the Town's jurisdiction.

We have also applied this growth rate to the Regional roads within the study area. This 2.0% compounded growth rate represents a conservative approach (i.e., errs on the high side). Detailed discussion can be found in **Section 3.5**.

As per review comments, this growth rate has been applied to through movements only on the study roadways. Town staff also confirmed there were no background developments to include as part of the traffic forecasts.

Figure 4.1 illustrates the forecast background traffic volumes for the 2032 horizon year.

4.3 Site Trip Generation

4.3.1 Vehicle Trip Generation

Trip generation for the subject development has been estimated using information contained in the Institute of Transportation Engineers (ITE) publication, "Trip Generation Manual, 11th Edition"¹¹.

Specifically, trip equations for Land Use Code (LUC) 221 – Multifamily Housing (Mid-Rise) were used. This land use is defined as "apartments and condominiums located in a building that has between four and ten floors of living space".

Table 4.1 summarizes the trip generation estimates and indicates the site is forecast to generate a total of 105 new vehicle trips in the AM peak hour and 104 new vehicle trips in the PM peak hour.

As noted in **Section 3.4**, trips to and from the study area are predominantly automobile based (accounting for approximately 90% or higher of all trips). It is noted that no adjustments have been made to account for trips made by transit or alternative travel modes.

TABLE 4.1: SITE TRIP GENERATION

LUC	Units	AM Peak Hour				PM Peak Hour			
		Rate	In	Out	Total	Rate	In	Out	Total
221	264	Eqn. 1	24	81	105	Eqn. 2	63	41	104
Total Trip Generation		24	81	105		63	41	104	

¹ – AM: $T = 0.44(X) - 11.61$ (23% inbound, 77% outbound)

² – PM: $T = 0.39(X) + 0.34$ (61% inbound, 39% outbound)

4.3.2 Site Trip Distribution and Assignment

Trip distribution for the development site is based on a review of existing traffic patterns and trip distribution data extracted from 2016 Transportation Tomorrow Survey (TTS) data. **Table 4.2** and **Table 4.3** summarize existing travel patterns based on intersection turning movement count data, and 2016 TTS trip distribution data, respectively.

TTS trip distribution was then combined with existing traffic pattern distributions by estimating by route. **Table 4.4** illustrates the estimated site trip distribution. **Appendix E** details trip distribution calculations.

¹¹ Institute of Transportation Engineers, *Trip Generation Manual (11th Edition)*, September 2021.

TABLE 4.2: EXISTING TRAVEL PATTERN DISTRIBUTION

Origin/Destination	AM Peak Hour		PM Peak Hour	
	In	Out	In	Out
North via Regional Road 50	36%	26%	30%	36%
South via Regional Road 50	29%	52%	48%	32%
West via Mayfield Road	10%	14%	13%	10%
North via Albion Vaughan Road	25%	8%	9%	22%
Total	100%	100%	100%	100%

TABLE 4.3: TTS TRIP DISTRIBUTION

Origin/Destination	AM Peak Hour		PM Peak Hour	
	In	Out	In	Out
North	65%	44%	33%	61%
South	23%	50%	57%	22%
West	12%	6%	10%	17%
Total	100%	100%	100%	100%

TABLE 4.4: ESTIMATED SITE TRIP DISTRIBUTION

Origin/Destination	AM Peak Hour		PM Peak Hour	
	In	Out	In	Out
North via Regional Road 50	38%	34%	25%	38%
South via Regional Road 50	23%	50%	57%	22%
West via Mayfield Road	12%	6%	10%	17%
North via Albion Vaughan Road	27%	10%	8%	23%
Total	100%	100%	100%	100%

The estimated trip generation has been assigned to the study road network based on the distribution noted in **Table 4.4**. Based on the intended operation of the north and south driveway connections for service and delivery vehicles exclusively, all site traffic has been assigned to the central middle access driveway.

Figure 4.2 illustrates the site-generated vehicle traffic assignment for the AM and PM peak hours. Slight differences from the trip generation estimates are due to rounding.

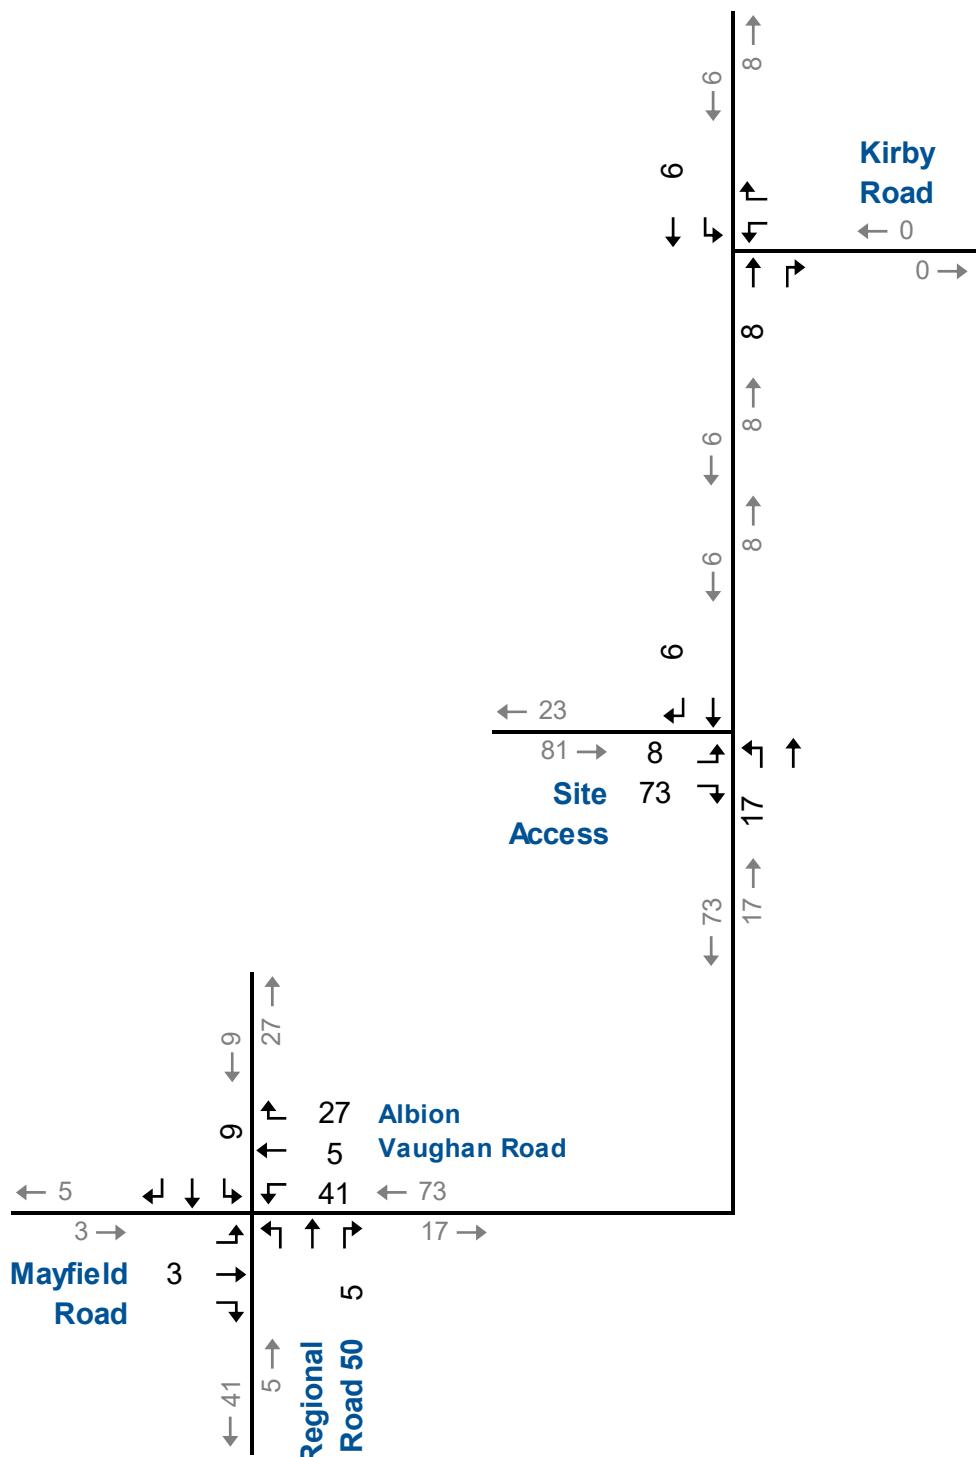

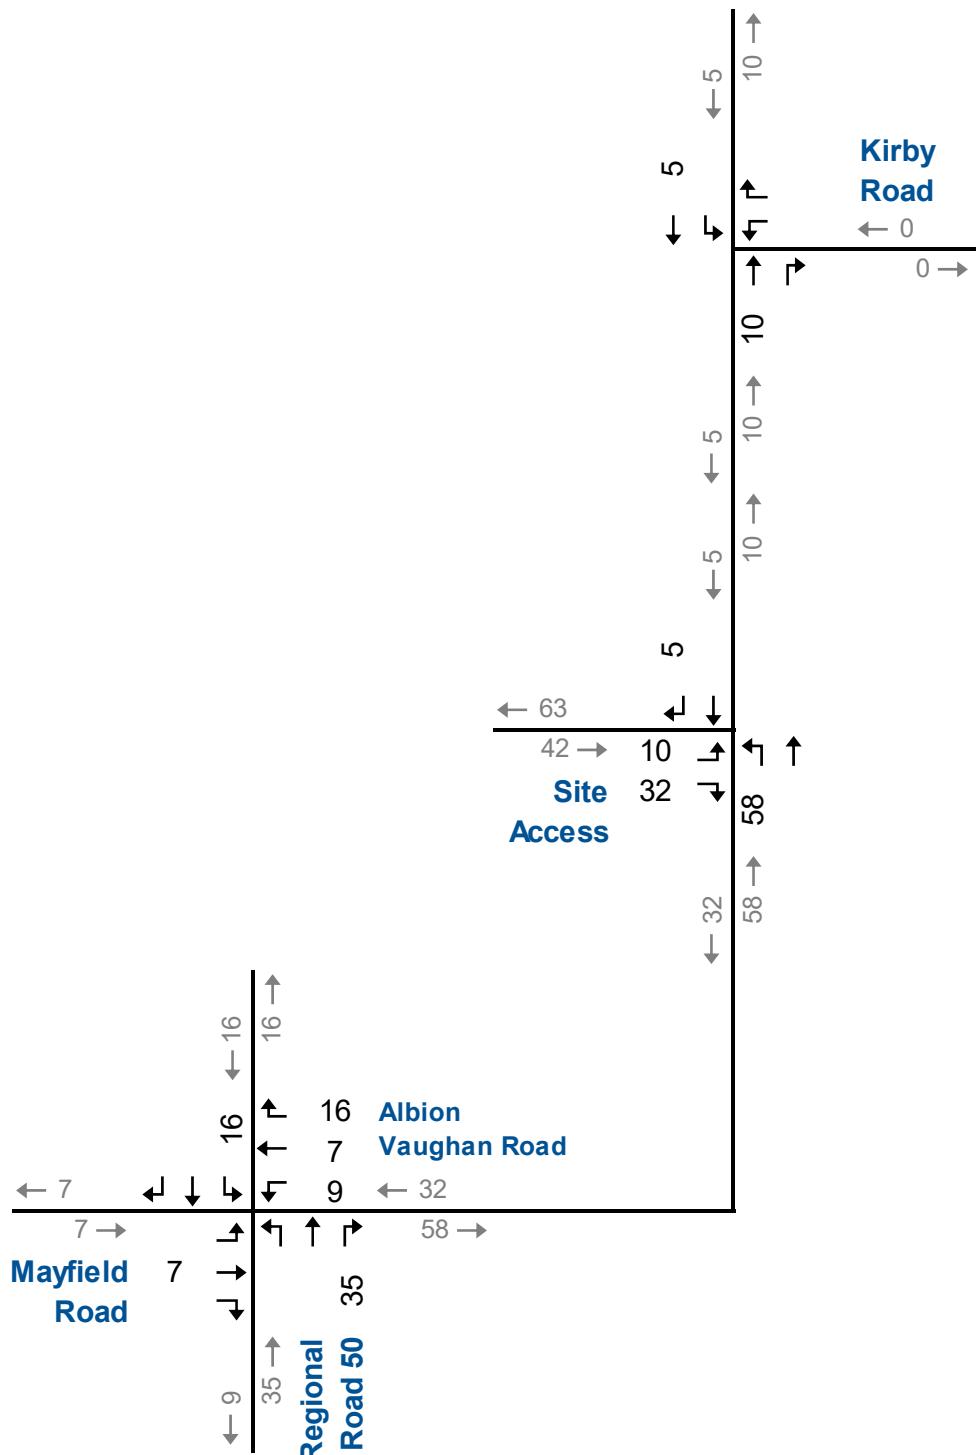

4.4 Forecast Total Traffic

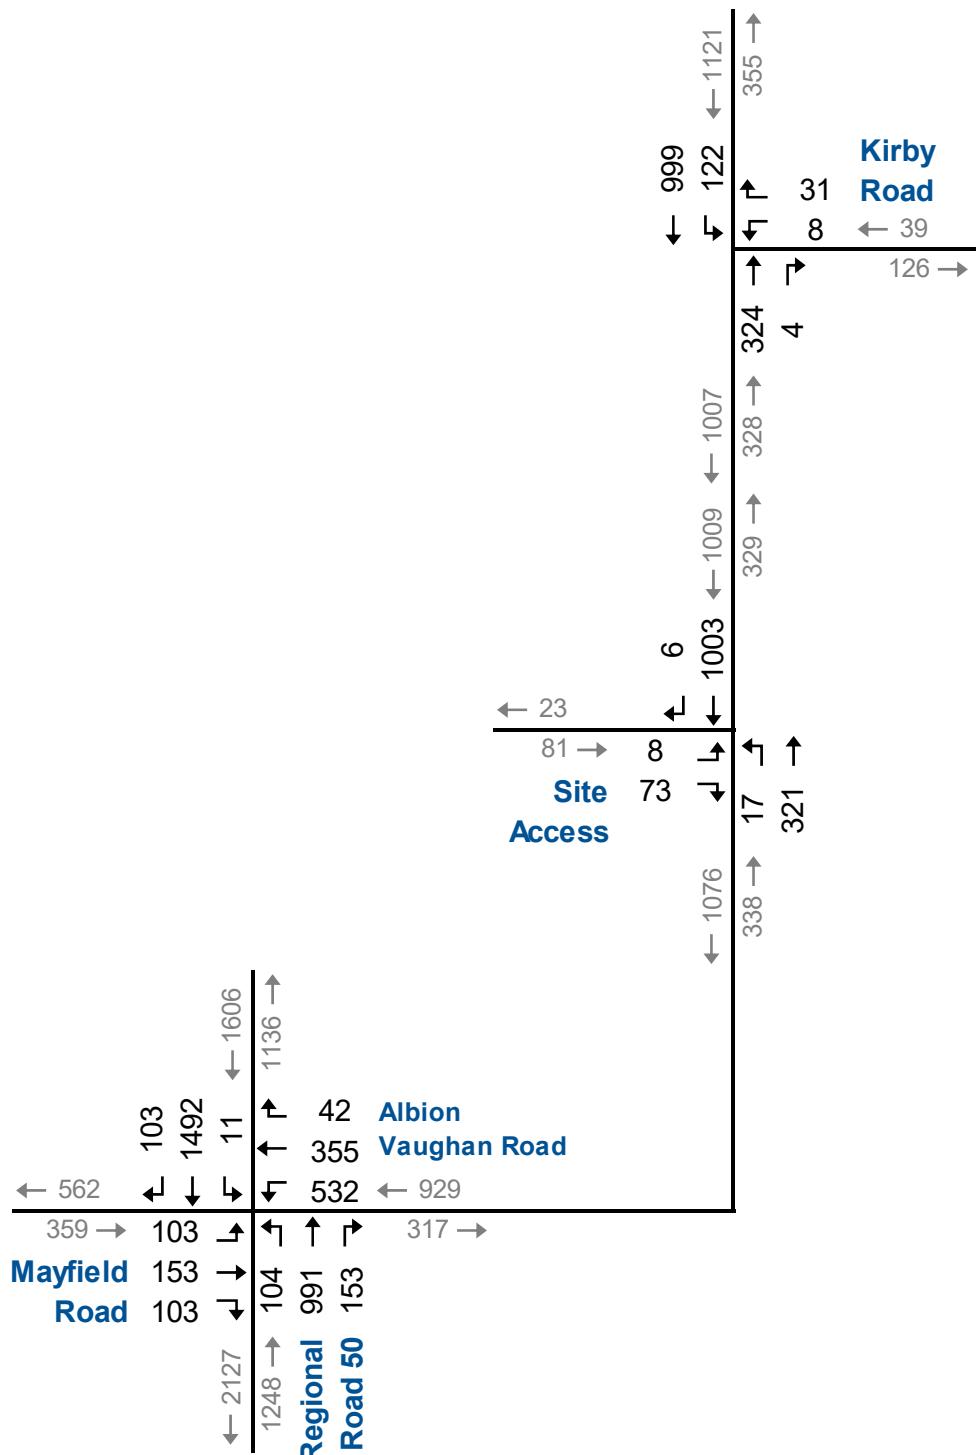

The future background traffic forecasts were combined with the site traffic assignments to estimate the future total traffic volumes for the 2032 horizon year.

Figure 4.3 illustrates the 2032 total traffic forecasts.

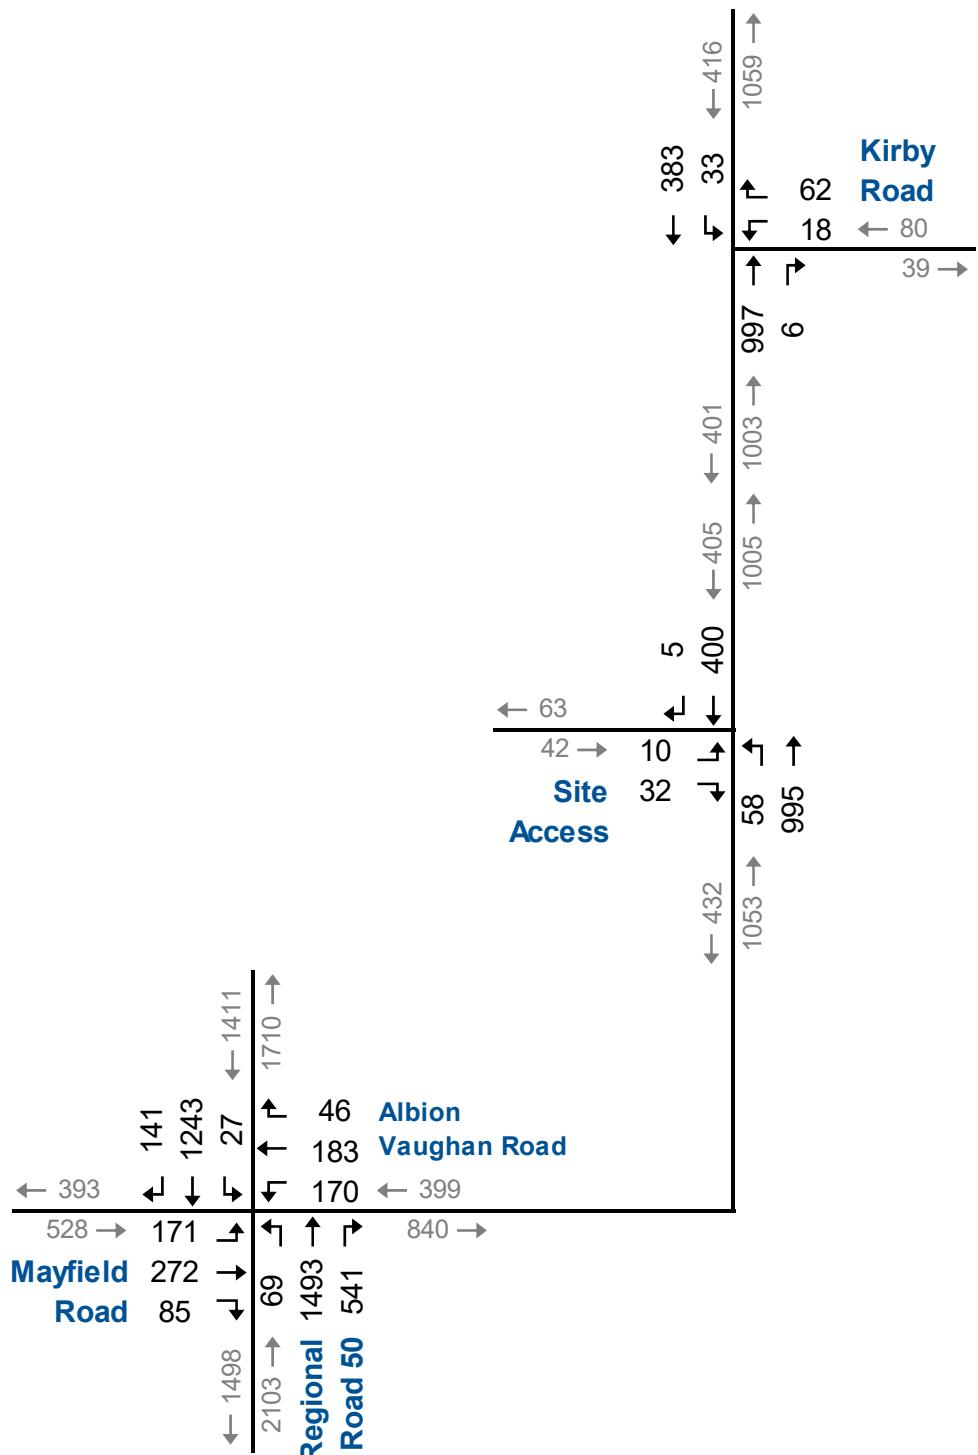

2032 Total Traffic Volumes AM Peak Hour

Figure 4.3A

5 Transportation Impact Assessment

5.1 Future Transportation Network

Reference is made to the Town of Caledon Multi-Modal Transportation Master Plan, June 2024. Figure 9-1, Proposed Travel Lanes for Town Roads by 2051, identifies the widening of Albion-Vaughan Road between Regional 50 and King Street to be widened to four-lanes by 2031.

As our horizon year for assessment is 2032, we've undertaken our initial analysis without the widening of Albion-Vaughan Road, representing a conservative approach.

5.2 Future Background Traffic

To assess the operating conditions for the 2032 horizon year, analyses were undertaken using the same methodology, parameters, and traffic control devices as in the analysis of base year conditions.

The exception includes the optimization of timing splits within existing cycle lengths to improve traffic operations for all movements. **Table 5.1** presents the signal timing splits at the intersection of Regional Road 50 and Albion Vaughan Road/Mayfield Road for the existing and background conditions.

TABLE 5.1: SIGNAL TIMING SPLITS

Condition	Phase 1	Phase 2	Phase 3	Phase 4	Phase 6	Phase 7	Phase 8
	NBL	SBTL	WBL	EBTL	NBTL	EBL	WBTL
AM Peak Hour							
Existing	25 s	63 s	27 s	45 s	88 s	10 s	62 s
2032 Background	13.5 s	78 s	39 s	29.5 s	91.5 s	10 s	58.5 s
Change	-11.5 s	+15 s	+12 s	-15.5 s	+3.5 s	Nil	-3.5 s
PM Peak Hour							
Existing	25 s	50 s	10 s	40 s	75 s	10 s	40 s
2032 Background	25 s	50 s	10 s	40 s	75 s	10 s	40 s
Change	Nil						

Table 5.2 presents the operational analysis results including level of service (LOS), average vehicle delay in seconds, volume to capacity (v/c) ratio, and 95th percentile queues in metres for the 2032 horizon with the existing signal timing splits.

Table 5.3 presents the operational analysis results including level of service (LOS), average vehicle delay in seconds, volume to capacity (v/c) ratio, and 95th percentile queues length in metres for the 2032 horizon with signal timing optimization. Critical movements are highlighted in yellow, if any.

Appendix F contains the detailed Synchro reports.

Operations – Existing Timing Plans

That analysis of background conditions (without the subject development) indicates the study area intersection of Regional Road 50 and Albion Vaughan Road/Mayfield Road would operate with two critical movements under the AM peak hour.

- ▶ The overall intersection reports a v/c ratio of 1.02;
- ▶ The westbound left turn movement is forecast to operate at a LOS F with a v/c ratio of 1.13; and
- ▶ The southbound dual through movement is forecast to operate at a LOS E with a v/c ratio of 0.98.

Operations – Optimized Timing Plans

The analysis of background conditions (without the subject development) indicates the study area intersections are forecast to operate at acceptable level of services and within capacity under optimized signal timing plans.

The exception would be at the intersection of Regional Road 50 and Albion Vaughan Road/Mayfield Road during the AM peak hour. It is noted that the overall intersection and the critical movement would be within capacity (i.e., v/c < 1.00). The following critical movements are reported:

- ▶ The overall intersection reports a v/c ratio of 0.98; and
- ▶ Southbound dual through movement is forecast to operate at LOS D with a v/c ratio of 0.97.

5.3 Future Total Traffic

To assess operating conditions for the future total forecasts, an operational analysis was undertaken using the same methodology, parameters, and traffic control devices as in the analysis of background conditions.

Table 5.3 presents the operational analysis results including level of service (LOS), average vehicle delay in seconds, volume to capacity (v/c) ratio, and 95th percentile queues length in metres for the 2032 horizon. Critical movements are highlighted in yellow, if any.

Appendix G contains the detailed Synchro reports.

The analysis of total conditions (with the subject development) indicates the study area intersections would continue to operate at acceptable conditions, albeit slightly exacerbated with the inclusion of site-generated traffic.

The previously identified critical movements under background conditions would continue to be reported, albeit slightly exacerbated under total conditions. Under the AM peak hour, the westbound left turn movement is identified as a critical movement.

The site access intersection with Albion Vaughan Road is noted to operate at good levels of service and well within capacity.

5.4 Impact Assessment Summary

5.4.1 Site Traffic

Overall, the incremental impact of the proposed residential development is considered minor. The additional traffic would be less than daily traffic variations typically experienced (approximately 10%).

Table 5.4 provides a summary of how much traffic volumes will increase by with the subject residential development.

TABLE 5.4: TRAFFIC VOLUME INCREASE

Intersection	2029 Background vs. 2029 Total % Volume Increase (Total Entering)	
	AM Peak Hour	PM Peak Hour
Regional Road 50 & Albion Vaughan Road/Mayfield Road	2.2%	2.1%
Albion Vaughan Road & Kirby Road	0.9%	1.0%

Under the 2032 background conditions, the intersection of Regional Road 50 and Albion Vaughan Road/Mayfield Road is reported to operate approaching capacity. Similarly, the southbound dual through movement is forecast to operate approaching capacity. The same critical movements are identified under 2032 total conditions, along with the addition of the westbound left turn movement reported to be at-capacity.

With employers beginning to shift away from traditional office-based environments to work-from-home models and with commercial/retail and service-based businesses adapting by adjusting business hours and/or switching to web-based e-commerce storefronts, travel demands and patterns are changing.

In a post-COVID condition, it is plausible that traffic volumes may never reach pre-COVID levels as a result of this quantum shift that is being experienced. With changes in travel demand, behaviour, and patterns post-COVID due to changes in how office and business environments operate. The forecasts as analyzed are conservative and potentially under post-COVID conditions, traffic volumes may be considerably lower than forecast if the forecast growth is not materialized.

5.4.2 Network and Intersection Improvements

Aforementioned, reference to the Town's June 2024 Multi-Modal Transportation Master Plan identified the widening of Albion-Vaughan

Road from its current two-lane cross-section to a four-lane cross-section by 2031.

At the intersection of Regional Road 50/Albion-Vaughan Road, dual left-turn lanes for the westbound approach has been investigated as a potential mitigation measure to improve the intersection operations and the westbound left turn movement. From a volume perspective the movement would warrant the consideration of a dual left-turn lanes.

The westbound left-turn traffic volume is reported as 491 and 532 vehicles during the AM peak hour under the 2032 background and total traffic conditions, respectively. The amount of left-turn traffic exceeds the 300 vehicles per hour threshold identified by both the Highway Capacity Manual and the Transportation Association of Canada Geometric Design Guide for Canadian Roads for the consideration of dual left-turn lanes.

The following signal timing plan changes are proposed to provide the best possible traffic operations for all movements in the event that westbound dual left-turn lanes are implemented.

- ▶ The westbound left-turn movement turn type shall be changed from permitted/protected to a fully-protected movement; and
- ▶ Optimization of signal timing splits within the existing cycle lengths.

Table 5.5 presents the proposed signal timing split changes for the AM peak hour for the existing, background and total conditions.

TABLE 5.5: SIGNAL TIMING SPLITS – WB DUAL LEFT-TURN LANES

Condition	Phase 1	Phase 2	Phase 3	Phase 4	Phase 6	Phase 7	Phase 8
	NBL	SBTL	WBL	EBTL	NBTL	EBL	WBTL
AM Peak Hour							
Existing	25 s	63 s	27 s	45 s	88 s	10 s	62 s
2032 Background	16 s	76 s	28.5 s	39.5 s	92 s	11.5 s	56.5 s
2032 Total	16 s	76 s	29 s	39 s	92 s	10 s	58 s
PM Peak Hour							
Existing	25 s	50 s	10 s	40 s	75 s	10 s	40 s
2032 Background	11 s	60.4 s	14 s	39.6 s	71.4 s	13 s	40.6 s
2032 Total	9 s	64.4 s	12 s	39.6 s	73.4 s	12 s	39.6 s

Table 5.6 and **Table 5.7** present the results of the operational analysis for the 2032 background and total traffic conditions, respectively with the implementation of westbound dual left-turn lanes and planned widening of Albion-Vaughan Road. **Appendix H** contains the Synchro analysis outputs for reference.

With the provision of dual left-turn lanes on the westbound approach, and accounting for the planned road widening the Regional Road 50/Albion-Vaughan Road intersection is reported to operate at acceptable levels of service and with all movements within capacity. No more critical movements are identified.

The Albion-Vaughan Road intersections with Kirby Road and at the Site Access driveway are forecast to operate at acceptable conditions and with all movements well within capacity.

Albion Vaughan Road and Site Access

Aforementioned, the Town's Multi-Modal Transportation Master Plan has identified the widening of Albion-Vaughan Road to a four-lane cross-section by 2031.

From an operational standpoint, auxiliary turn lanes on Albion Vaughan Road are not necessary as the shared northbound left/through-through movement and the shared southbound through-through/right movements are both reported to operate at LOS A and the movements are forecast to be well within capacity.

Regardless, the warrants for left-turn lanes within the Ontario Ministry of Transportation's (MTO) *Design Supplement* to the TAC *Geometric Design Guide for Canadian Roads* (TAC Guide) were investigated for four-lane undivided roads. The warrant is based on a combination of the advancing and opposing design hour volumes, and the design speed of the road.

A warrant analysis has been completed using the nomographs for four-lane, unsignalized intersections, with a design speed of 80 km/h (20 km/h over the posted speed limit). **Table 5.8** summarizes the details of the left-turn warrant analysis. **Appendix I** contains the warrant analysis sheets for reference.

TABLE 5.8: LEFT-TURN LANE WARRANT ANALYSIS

Major Street	Albion Vaughan Road	
Minor Street	Site Access	
Approach Direction	Northbound	
Peak Hour	AM	PM
Opposing Volume	1,009	405
Left Turning Volume	17	58
Warranted	Yes	Yes

Based upon 2032 total traffic forecasts, a northbound auxiliary left-turn lane providing a minimum storage length of 15.0 metres is determined to be warranted from a volume perspective.

Based upon the low forecast volumes of southbound right-turn volumes, it is determined that an auxiliary right-turn lane would not be necessary. As the forecast volume of turning traffic is low, it is anticipated that these vehicles will not impede southbound traffic on Albion Vaughan Road or cause any undue hazard to through traffic.

6 Parking Review

6.1 Development Overview

The proposed residential development comprises two residential towers, with a total of 264 residential dwelling units. The development statistics are as follows:

- ▶ One six-storey residential tower with 114 units total:
 - 37 one-bedroom units;
 - 22 one-bedroom + den units;
 - 31 two-bedroom units;
 - 18 two-bedroom + large balcony units;
 - 6 three-bedroom units.
- ▶ One seven-storey residential tower with 150 units total:
 - 40 one-bedroom units;
 - 14 one-bedroom + den units;
 - 68 two-bedroom units;
 - 21 two-bedroom + large balcony units;
 - 7 three-bedroom units.

A total of 468 parking spaces serving residents and visitors are proposed on-site, including 12 accessible parking spaces. The parking supply breakdown is as follows:

- ▶ 8 spaces at-grade;
- ▶ 223 spaces on parking level P1; and
- ▶ 237 spaces on parking level P2.

6.2 Zoning By-law Vehicular Parking Requirements

Table 6.1 presents a comparison of the required and proposed number of vehicle parking spaces under the Town of Caledon Zoning By-law, Section 5: Parking, Loading and Delivery Standards¹².

The proposed vehicle parking supply satisfies the Town's By-law requirements and results in a surplus of six (6) parking spaces.

¹² Town of Caledon, *Zoning By-law, Section 5: Parking, Loading and Delivery Standards*, February 10 2022.

TABLE 6.1: REQUIRED AND PROVIDED PARKING

Type of Use	By-law Requirement	Parking Spaces		
		Required	Provided	Net Surplus (Deficiency)
Building, Apartment (264 units)	1.5 spaces per dwelling unit for residents	396	401	+5
	0.25 spaces per unit for visitors	66	67	+1
Total		462	468	+6

6.3 Accessible Parking Requirements

The accessible parking requirements for the subject site have been verified against the Town of Caledon Zoning By-law 2015-58, Schedule K: Designed Accessible Parking Spaces¹³.

The minimum number of accessible parking spaces is two accessible spaces plus 2% of the proposed parking spaces, when the required number of parking spaces is between 201 and 1000.

Table 6.2 presents a comparison of the required and proposed number of accessible parking spaces. The proposed accessible parking supply for the residential development meets and satisfies the Town's By-law requirements with a surplus of one accessible parking space.

TABLE 6.2: REQUIRED AND PROVIDED ACCESSIBLE PARKING

Proposed Parking Supply	By-law Requirement	Parking Spaces		
		Required	Provided	Net Surplus (Deficiency)
468 spaces	2 spaces + 2% of total proposed parking spaces	11	12	+1
Total		11	12	+1

¹³ Town of Caledon, *Zoning By-law 2015-58, Schedule K: Designed Accessible Parking Spaces*, Effective 27 April 2021.

6.4 Bicycle Parking

As the Town's ZBL does not stipulate any municipal requirements for bicycle parking, Town staff per the latest review requested that bicycle parking rates for comparable municipalities be provided for information. **Table 6.3** provides a summary.

TABLE 6.3: BICYCLE PARKING REQUIREMENTS (OTHER MUNICIPALITIES)

Municipality	Bicycle Parking Requirements
City of Brampton	LT: 0.5 spaces/dwelling unit ST: 0.1 spaces/dwelling unit
City of Vaughan	LT: 0.5 spaces/dwelling unit ST: 0.1 spaces/dwelling unit, or 3 spaces, which is greater
City of Markham	LT: 0.5 spaces/dwelling unit ST: 0.1 spaces/dwelling unit, or 3 spaces, which is greater
Town of Whitby	None
Town of Ajax	None
City of Oshawa	None

A total of 86 bicycle parking spaces, broken down to 30 short-term (0.11 spaces/unit) and 56 long-term (0.21 spaces/unit) spaces are proposed on-site.

It is noted the proposed short-term bicycle parking provisions are generally inline with what other municipalities require. Whereas, the proposed long-term bicycle parking provisions are noted to be deficient in comparison to other municipalities.

Given there is no proposed reduced vehicular parking, and the locational context of the site with no immediate plans for extensions of cycling networks/routes within vicinity of the site, the proposed bicycle parking supply is determined to be currently adequate for the site.

While the provision of a larger compliment of long-term bicycle parking spaces would encourage cycling, it is noted with the absence of any dedicated bicycle infrastructure, cyclists would have to share the travelled roadways with vehicles.

In terms of long-term bicycle parking space specifications, reference is made to the details noted within the City of Vaughan's ZBL. Bicycle parking space dimensions are summarized below:

- ▶ Minimum space dimensions:

- Length = 1.8 m;
- Width = 0.6 m; and
- Vertical clearance from the flow = 1.9 m.

If vertical bicycle parking spaces are proposed, they shall have the following dimensions:

- ▶ Minimum space dimensions for a vertical bicycle parking space:
 - Length or vertical clearance = 1.9 m;
 - Width = 0.6 m; and
 - Clearance from the wall = 1.2 m.

For any stacked bicycle parking spaces, the minimum vertical dimension for each bicycle parking space shall be 1.2 m and the minimum vertical clearance from floor shall be 2.4 m.

Short-term bicycle parking shall be accommodated by bicycle racks.

7 Circulation Review

AutoTURN software was used to review and confirm that design of the site accesses, internal circulation, and loading areas will accommodate the types of vehicles expected on-site. This involved the following tasks:

- ▶ Showing how a Region of Peel waste collection vehicle would enter the site, access the loading spaces, and exit the site;
- ▶ Showing how a Pumper Fire Truck would enter the site, circulate the designated fire route, and exit the site;
- ▶ Showing how a TAC Medium Single-Unit (MSU) truck (design vehicle representing typical service and delivery truck) would enter the site, access the loading spaces, and exit the site; and
- ▶ Showing how a TAC Passenger Car (design vehicle representing a large car) would enter the site, circulate, access the underground parking structure, and exit the site.

Our review of the underground parking levels noted that all parking spaces and drive aisle widths meet zoning requirements. Furthermore, no dead-end drive aisles were noted and no parking spaces were flagged to have ingress or egress issues.

Each of the design vehicle manoeuvres described above are accommodated by the design of the site without issue or conflict.

Appendix J contains the vehicle maneuvering diagrams for reference.

8 Conclusions and Recommendations

8.1 Conclusions

The conclusions of the study are as follows:

- ▶ Under the base year conditions, all study area intersections operate at acceptable levels of service and within capacity.
- ▶ For the 2032 background traffic conditions (without subject development), all study area intersections are forecast to operate at acceptable levels of service and within capacity.

The exception would be the Regional Road 50 and Albion Vaughan Road/Mayfield Road intersection, where the overall intersection v/c ratio is forecast to be 0.98 during the AM peak hour. The southbound dual through movement is reported to operate with a v/c of 0.97 during the AM peak hour.

- ▶ Under the 2032 total traffic conditions (with subject development), all study area intersections are forecast to operate at acceptable levels of service and within capacity.

The previously identified critical movements would continue to be reported, albeit slightly exacerbated, with the addition of the westbound left turn movement identified under the AM peak hour.

- ▶ The overall impact of the proposed residential development is anticipated to be minimal. The development is estimated to generate and add a total of 105 and 104 vehicle trips to the adjacent transportation network during the AM and PM peak hours, respectively.

The additional traffic would be less than daily traffic variations typically experienced. It is determined the site generated traffic would increase volumes at the study area intersections between 0.9 to 2.2%;

- ▶ To mitigate identified critical movements under total traffic conditions, the planned road widening of Albion-Vaughan Road, and auxiliary dual left-turn lanes were investigated at the westbound approach at the intersection of Regional Road 50 and Albion Vaughan Road/Mayfield Road intersection.

As analyzed with the planned road widening, and dual left-turn lanes on the westbound approach and optimization of signal timing splits within exiting cycle lengths, the overall intersection is reported to operate at acceptable levels of service and with all movements within capacity under the 2032 horizon.

- ▶ At the main central site access intersection with Albion Vaughan Road, it was determined an auxiliary northbound left-turn lane would be warranted from a volume perspective for the future four-lane cross-section of Albion-Vaughan Road;
- ▶ The proposed vehicular parking supply satisfies the minimum zoning by-law requirements.
- ▶ A review of the site plan was undertaken. No major conflicts or issues were identified for the anticipated design vehicles expected on-site.

8.2 Recommendations

The recommendations of the study are as follows:

- ▶ From a transportation perspective, the planning applications sought should be approved as the development is determined to have a minimal impact on the adjacent transportation network;
- ▶ Provision of a northbound left-turn lane on Albion-Vaughan Road to serve the site's central access;
- ▶ The Town of Caledon to provide the planned widening Albion-Vaughan Road to four-lanes by 2031 as identified within the Multi-Modal Transportation Master Plan; and
- ▶ The intersection volumes and operations at the Regional Road 50 and Albion Vaughan Road/Mayfield Road intersection be monitored by the applicable jurisdiction to determine when dual westbound left-turn lanes should be provided.

Subject: 200428 - 12148 Albion Vaughan Road TIS Scope of Work

CAUTION: This email originated from outside of the organization. Do not click links or open attachments unless you recognize the sender and know the contents to be safe.

Hi Arash & Catherine,

We've been retained to prepare a Traffic Impact Study (TIS) for a residential development on the west side of Albion Vaughan Road, south of Kirby Road in Bolton. We're reaching out to both the Region and Town to confirm our scope of work. If you are not the correct point of contact, please let us know so we can contact the correct person. We would appreciate any comments by the week of November 2.

The development proposal includes 240 condominiums in a six-storey building, and 10 townhomes. Access is proposed through a new all-moves driveway connection to Albion Vaughan Road. Two separate driveway connections for loading and delivery vehicles are also proposed on the north and south edges of the site.

Based on the above, we propose the following work plan to carry out the TIS:

1. Analysis of AM and PM peak hours.
2. Horizon year five years ~~from date of study~~ (2025). Please confirm. **From completion/built out date**

3. Study area to include:
 - Highway 50 & Mayfield Road/Albion Vaughan Road; and
 - Albion Vaughan Road & Kirby Road.

We have turning movements completed at both intersections on Thursday November 24, 2016. Are these counts acceptable given the current impacts of COVID-19 on traffic volumes? **Please confirm** an appropriate growth rate to factor these volumes to a 2020 base year. **I suggest adopt 2%**

4. Background traffic to be forecast using a per annum growth rate. **Please confirm appropriate growth rate. 2%**
5. Background developments to be included? **Please confirm. No background development**
6. ITE *Trip Generation Manual (10th Edition)* rates to establish trip generation
7. Mode share based on TTS.
8. Trip distribution derived from turning movement counts and origin/destination information obtained from TTS.
9. AutoTURN assessment to include relevant design vehicles expected on the site, and swept path analysis.

Please let me and Adrian Soo (cc'd on this e-mail) if you have any questions on the above work plan.

Thanks,

Andrew Steinsky, P.Eng.

Intersection Summary

~ Volume exceeds capacity, queue is theoretically infinite.

Queue shown is maximum after two cycles.

95th percentile volume exceeds capacity, queue may be longer.

Queue shown is maximum after two cycles.

Intersection Summary

- ~ Volume exceeds capacity, queue is theoretically infinite.
Queue shown is maximum after two cycles.
- # 95th percentile volume exceeds capacity, queue may be longer.
Queue shown is maximum after two cycles.
