1 INTRODUCTION

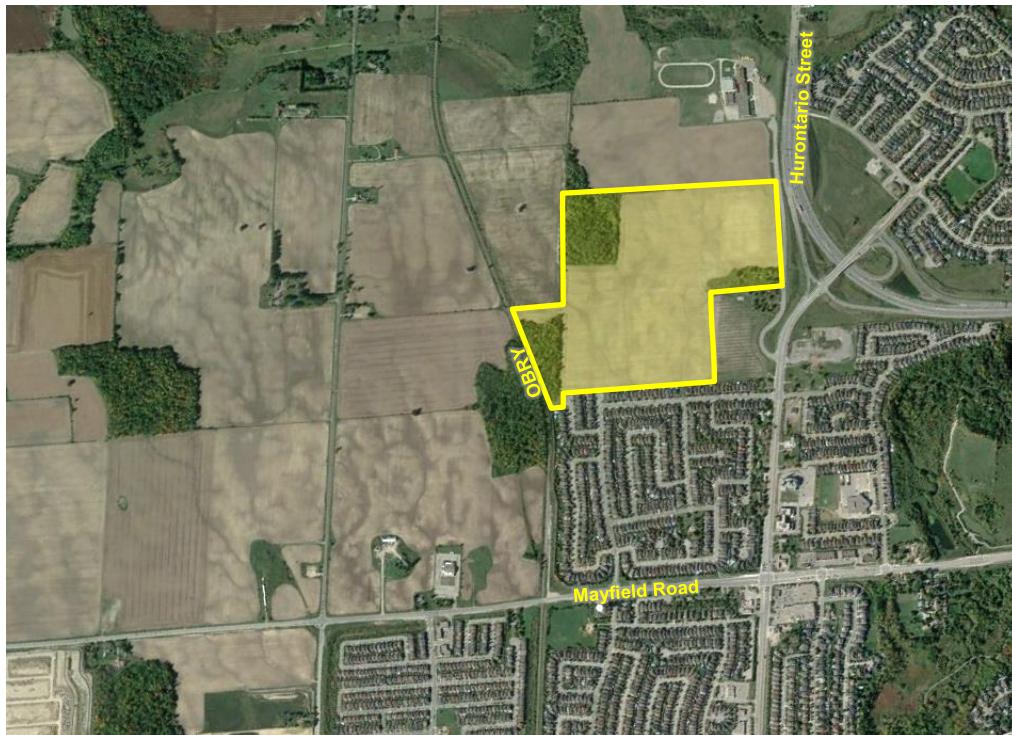

The Municipal Infrastructure Group (TMIG) has been retained by Caledon 410 Developments to prepare a Stormwater Management (SWM) Report in support of their Draft Plan of Subdivision application. The Caledon 410 site is a proposed 38.14 ha residential development is within the Mayfield West Phase 2 Secondary Plan Area, in the Town of Caledon. The proposed development is located west of Hurontario Street, east of the Orangeville-Brampton Railway (OBRY) and north of the existing subdivision as shown on **Figure 1-1**.

This report will:

- Provide background information,
- Summarize the existing site conditions,
- Provide information regarding the existing and proposed drainage catchment areas,
- Provide information regarding the proposed development,
- Provide an analysis of the proposed stormwater management facility, and
- Provide an analysis of the stormwater management strategy for the subject site.

The recommended stormwater management strategy has been developed in accordance with applicable design criteria and requirements of the Town of Caledon (Town), the Region of Peel (Region), Ontario Ministry of Environment and Climate Change (MOECC), and the Toronto and Region Conservation Authority (TRCA). The Stormwater Management Report presents information at a functional level and is intended to demonstrate feasibility. The functional servicing report (FSR) completed by TMIG for the same development should also be read in conjunction with this report. It should be noted that the detailed design will be supported by the Environmental Impact Study (EIS), hydrogeology and geotechnical studies in order to further refine the proposed Stormwater Management (SWM) strategy and pond design.

Figure 1-1: Location Plan

1.1 Background Information

The information contained within this report is based on the Functional Servicing Report for Mayfield West Phase 2 Secondary Plan Area (MW2 FSR), dated August 2017 prepared by Urbantech.

The MW2 FSR outlined the stormwater, sanitary and water servicing, a grading strategy, environmental constraints and mitigation measures, hydrogeology and the geotechnical guidelines for future developments for the overall secondary plan area. This SWM Report is consistent with the strategies outlined in the MW2 FSR and the standards of the regulatory agencies (Town, TRCA and MOECC).

This report is to be read in conjunction with other related reports supporting the proposed draft plan including:

- Environmental Impact Statement (EIS) prepared by Hensel,
- Geotechnical Report prepared by Terraprobe,
- Feature Based Water Budget Assessment prepared by PECG, and
- Caledon 410 Functional Servicing Report prepared by TMIG

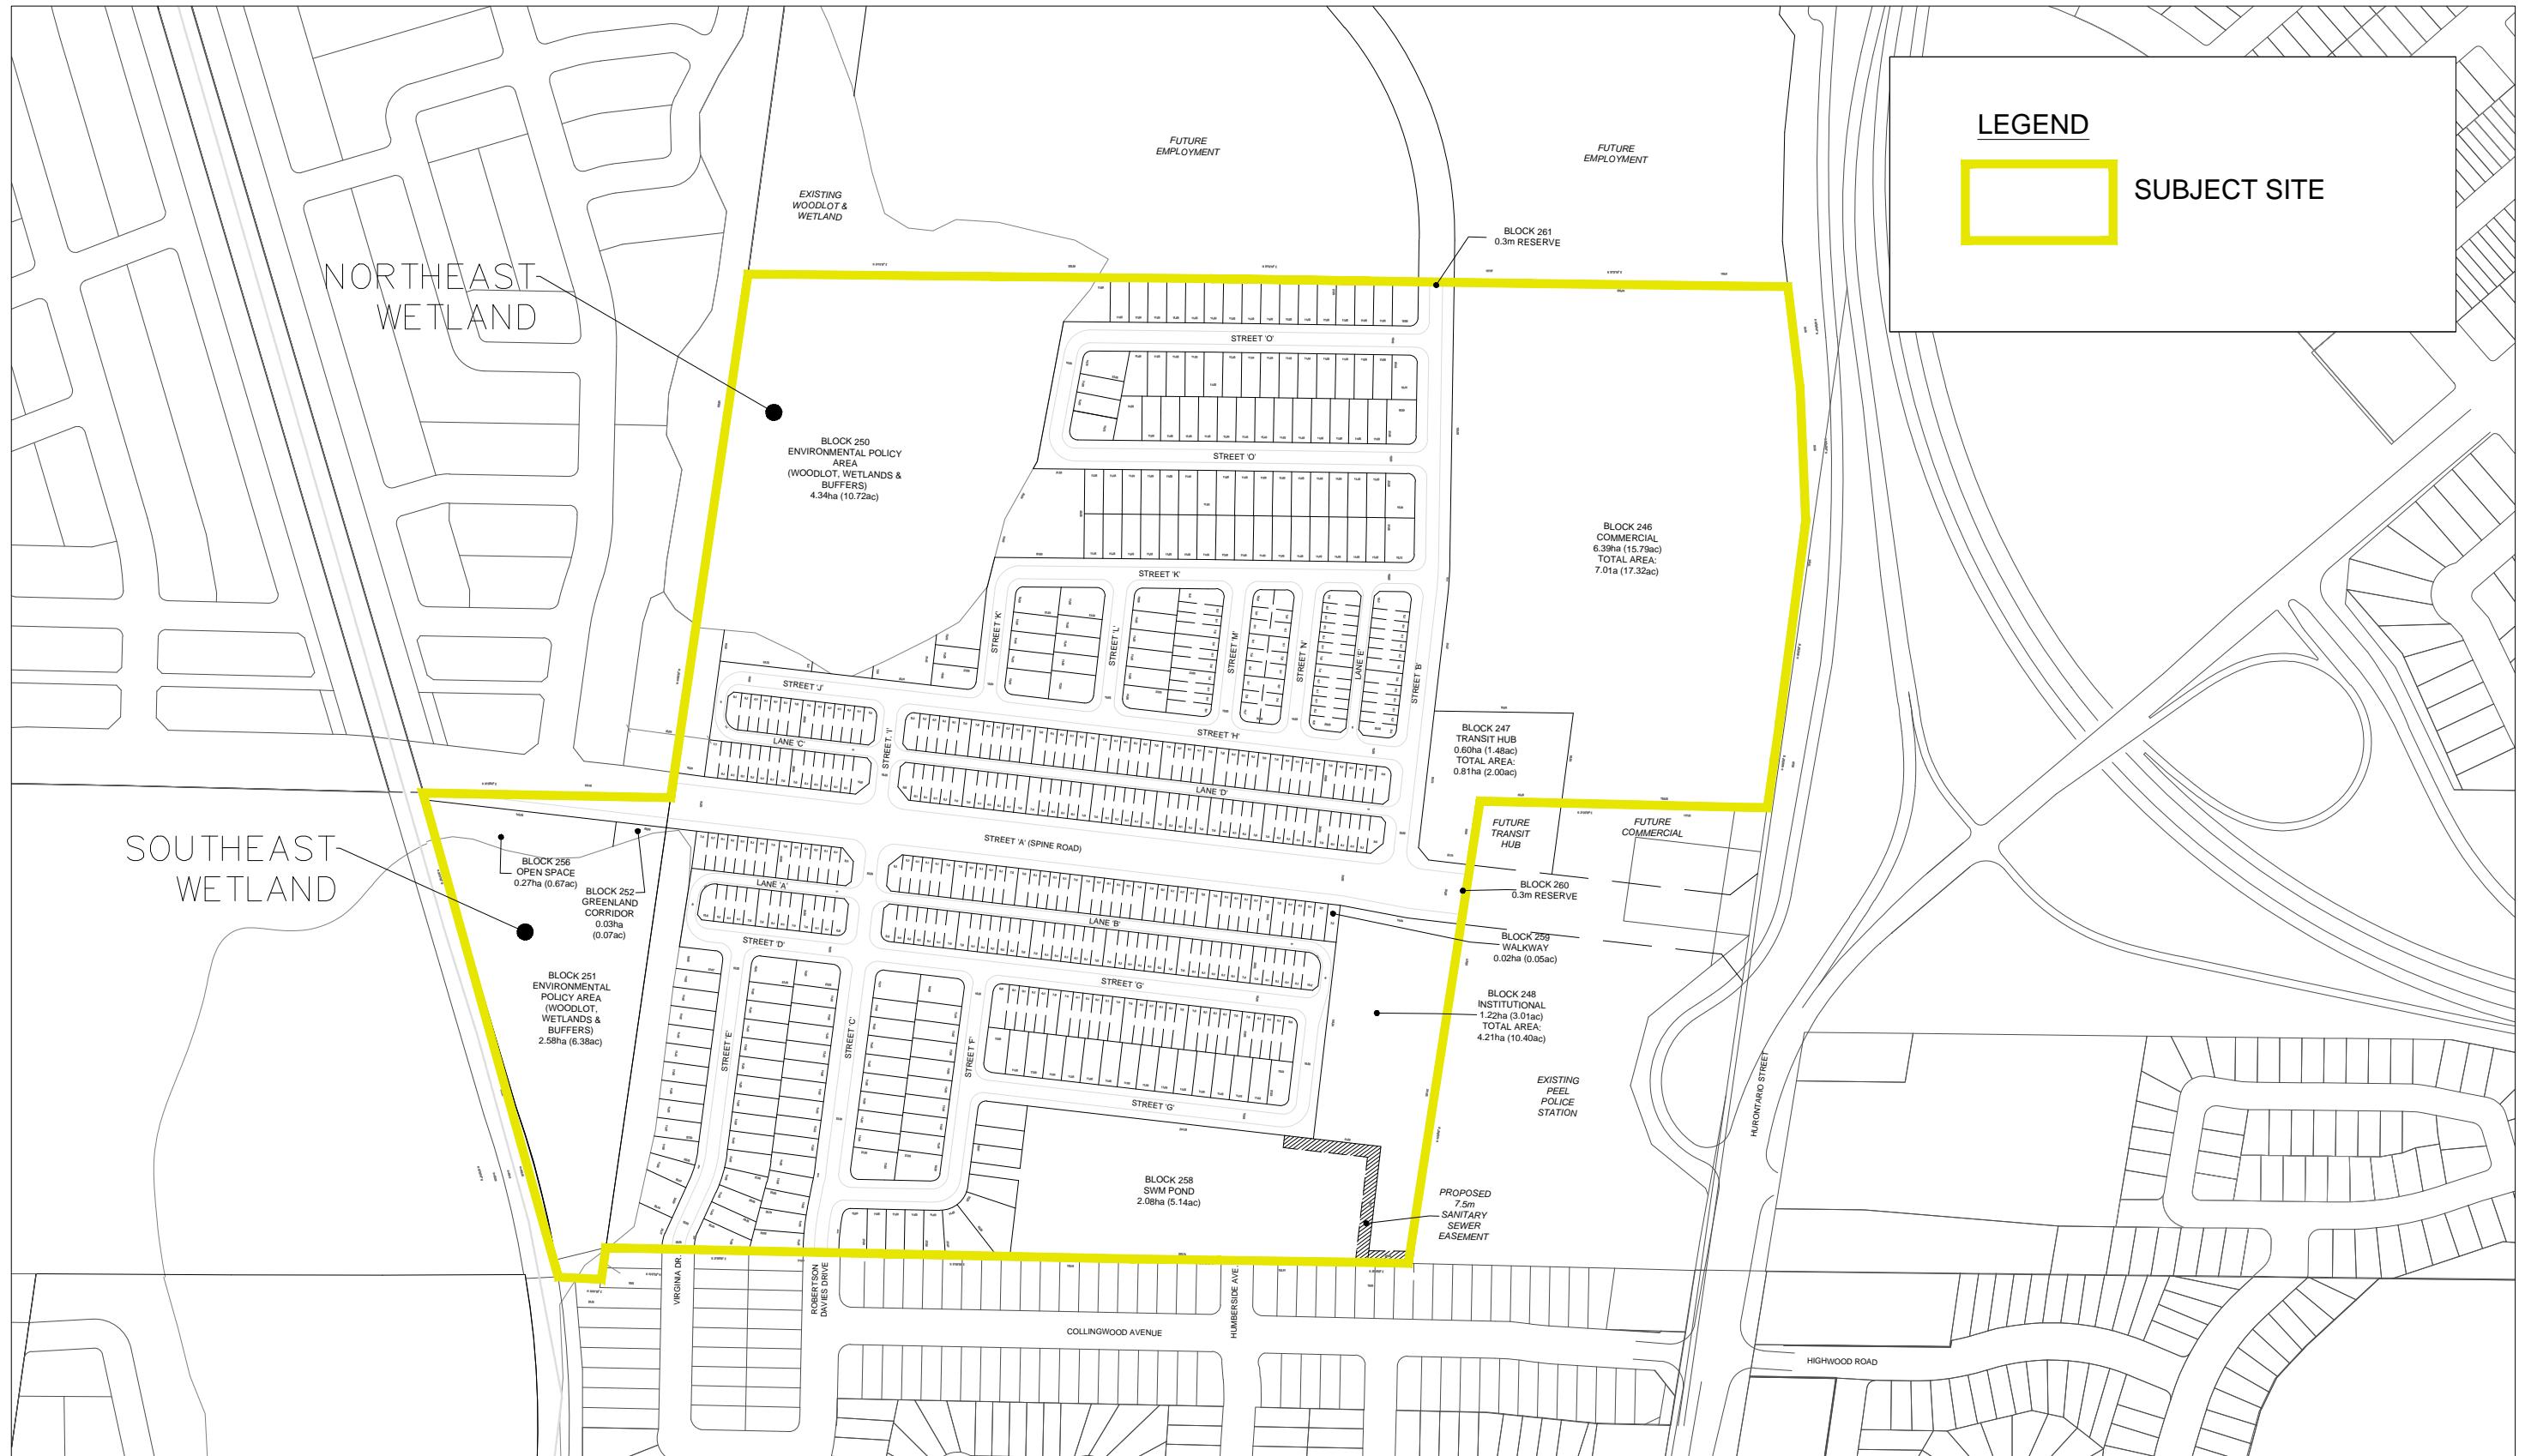

1.2 Proposed Development

The proposed development land uses include low density residential, medium density residential, an institutional block, roads, a stormwater management facility, park, open space, and Natural Heritage System (NHS). External drainage areas varying from 11.86ha to 10.76ha during the interim and ultimate condition will also flow onto the proposed development to the stormwater management (SWM) facility. The SWM facility on the subject site is identified as SWM Pond 9 in the MW2 FSR.

Table 1-1 summarizes the proposed land uses and corresponding development areas. The proposed road network and lot layout is based on the Draft Plan of Subdivision prepared by Glen Schnarr & Associates Inc., dated November 14, 2017.

Table 1-1 Proposed Land Use Areas

Land Use	Area (ha)
Residential (Detached)	6.95
Residential (Townhouses)	4.84
Commercial	6.39
Transit	0.6
Institutional	1.22
Park	0.25
Environmental Policy Area	6.92
Greenway Corridor	0.2
Open Space	0.29
SWM Pond	1.84
Walkway	0.02
Roads	8.62

1.3 Existing Conditions

1.3.1 Existing Topography and Natural Heritage System

The existing topography within the proposed development ranges in elevation from 263.64m to 256.82m. Existing topography falls generally from northwest to southeast from a ridge north of the subject site. The topography ranges in slope from 1% to 3%.

The existing land use is predominantly agricultural and rural in nature.

There are two natural heritage systems (NHS) located within the subject site. Two wetlands referred to as northeast wetland and southeast (TRCA wetland) in the Urbantech MW2 FSR are located along the western and southwestern boundary of the site.

The draft plan of subdivision as shown on **Figure 1-2** illustrates the proposed development in the context of the site's Natural Heritage System. For information on the detailed NHS and the width of the applied buffer, the corresponding Environmental Impact Statement (EIS) report should be reviewed.

1.3.2 Existing Drainage

As part of the Mayfield West Phase 2 FSR, existing drainage catchments were delineated for the entire Secondary Plan area.

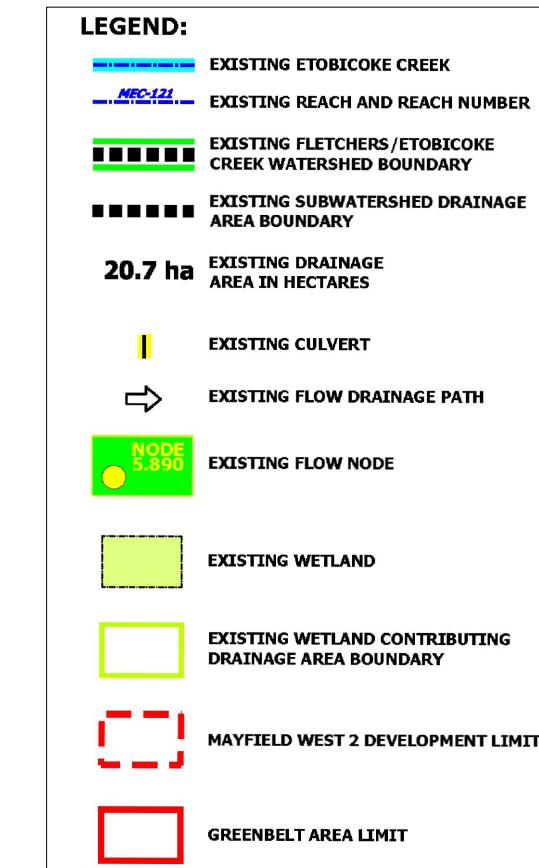

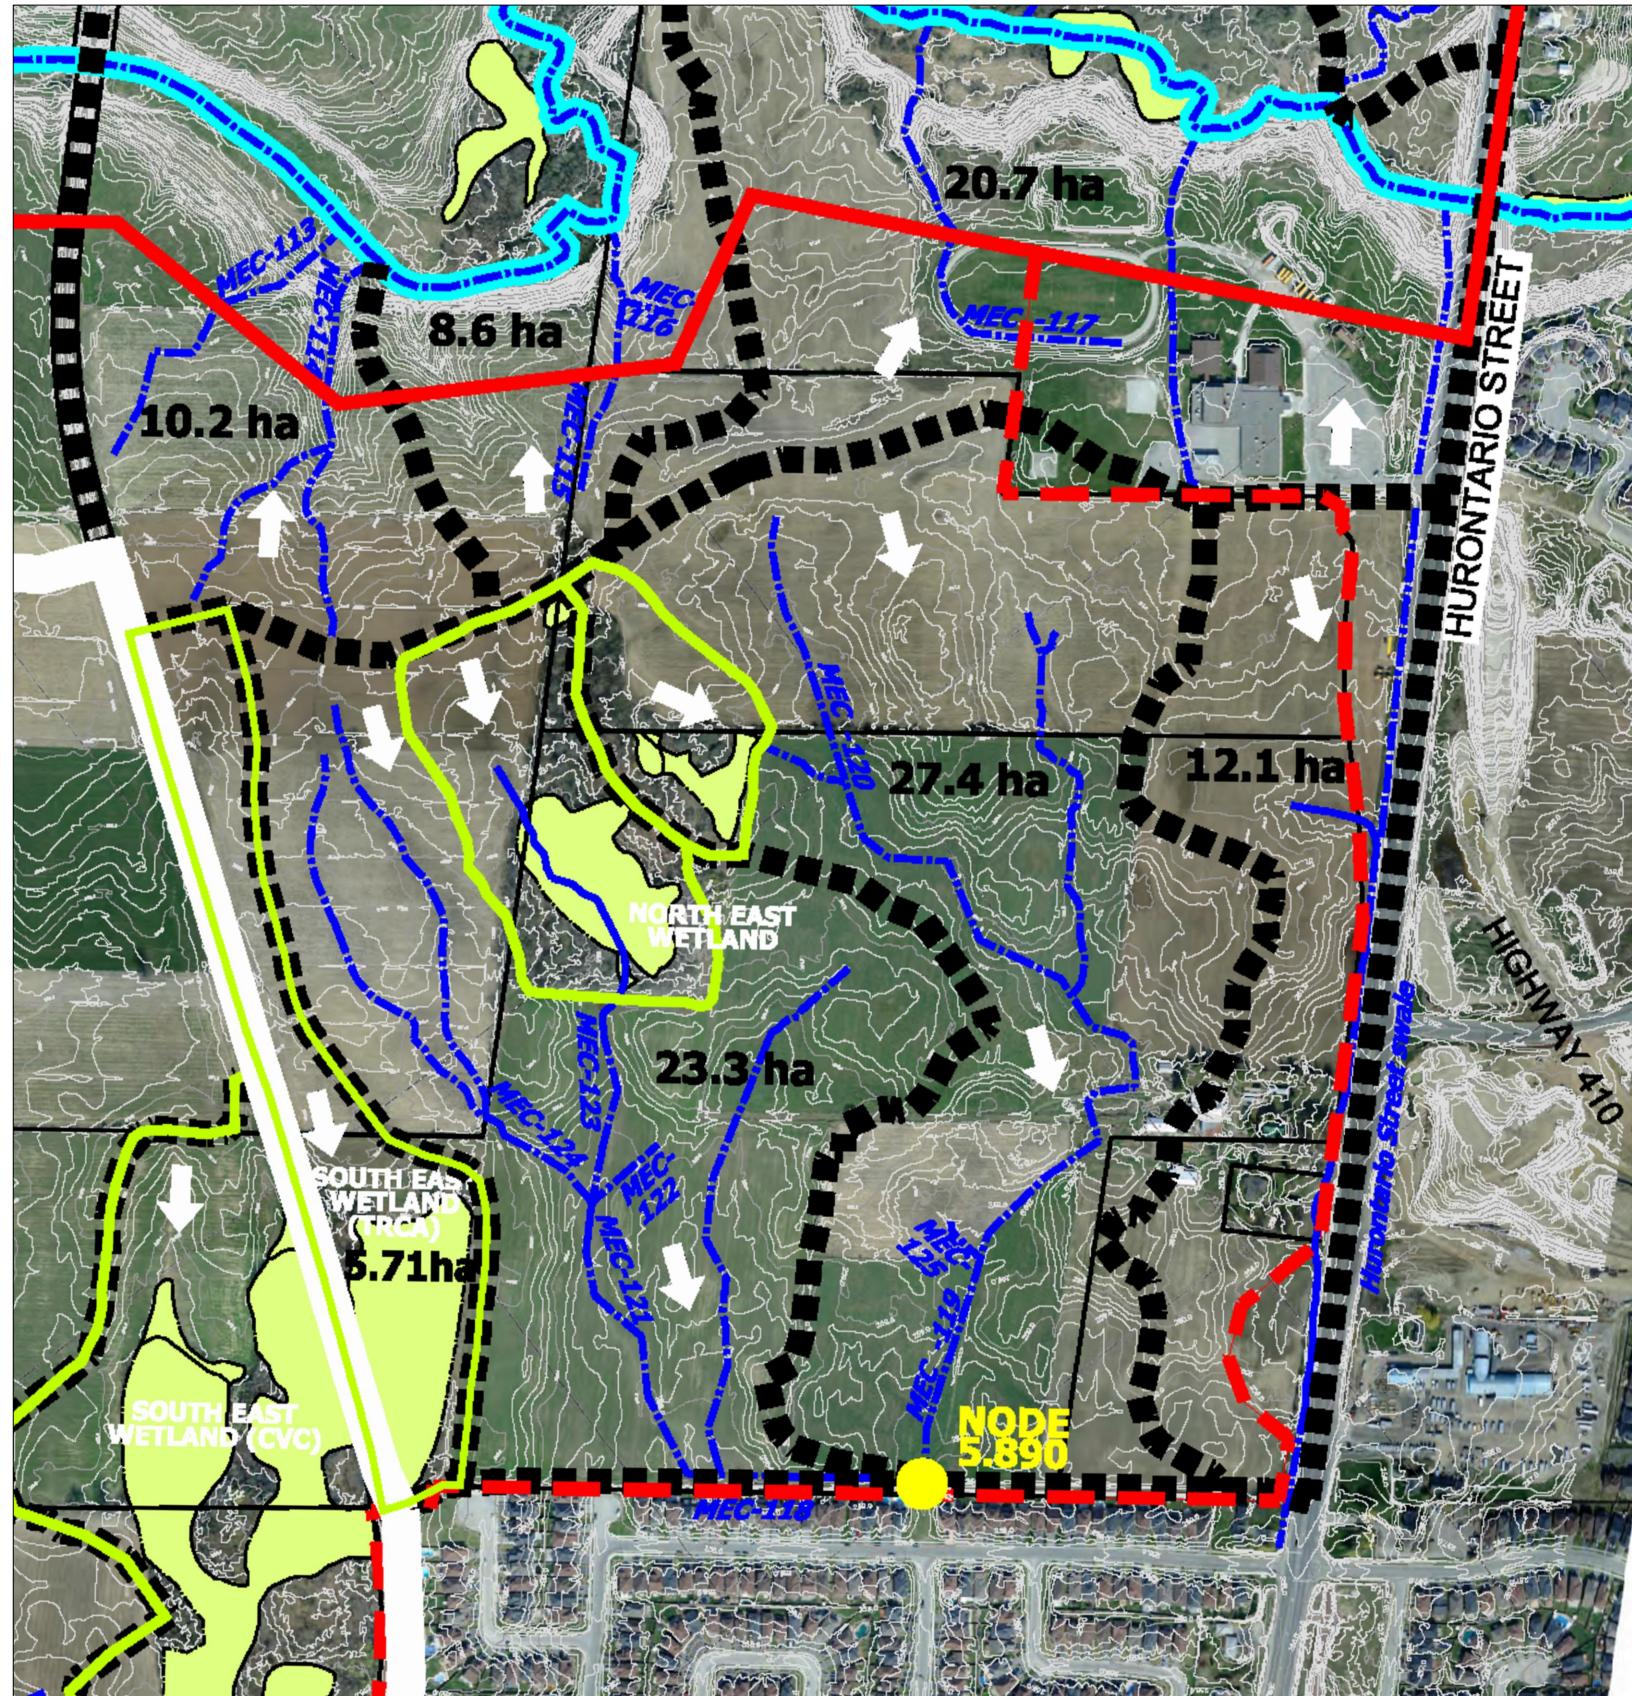

As can be seen on **Figure 1-3** the subject site falls within three existing drainage areas, two of which contributes to minor tributaries that converges at Node 5.890 and the other drains to the ditch along Hurontario Street. Node 5.890 from the southern boundary of the subject site is captured through an existing storm sewer on Humberside Drive. All of these catchment areas ultimately join downstream with the main Etobicoke Creek.

1.3.3 Physiography and Geology

The site is located within the South Slope physiographic region, which lies between the Oak Ridges Moraine and the Peel Plain (Chapman and Putnam, 1984). This area is characterized by a flat to gently rolling drumlinized till plain.

Overburden soils are dominated by clayey silt to silty clay Halton Till and range in thickness from 10 – 40 m near the site. The Halton Till may contain isolated lenses of lacustrine laminated sand, silt, and clay (Sharp et al., 1999). Fine grained glaciolacustrine sediments (silt and clay) were identified along the northern site boundary, immediately south of Etobicoke Creek. Bedrock consists of red shale interbedded with grey to green limestone, known as the Queenston Formation.

For further information on the Hydrogeological and Geotechnical conditions of the subject site, please refer to the report prepared by PECG for the overall Mayfield West Phase 2 Secondary Plan Area.

2 STORMWATER MANAGEMENT

Based on the MW2 FSR, there are two drainage scenarios to SWM Pond 9. The two scenarios have been identified as the ultimate and interim condition. During the ultimate condition all surrounding lands are assumed to be developed and existing drainage north of the subject site will be diverted northwards to a separate SWM facilities. During the interim condition, approximately 15.78ha of external drainage will be drain through the subject site to SWM Pond 9 following existing flow direction. The drainage area for the ultimate condition is 48.12ha and for the interim condition is 49.24ha. The proposed drainage areas are illustrated on **Figure 2-1** and **Figure 2-2** for the interim and ultimate condition respectively.

2.1 Stormwater Management Criteria

2.1.1 Erosion Control Criteria

Based on AMEC's approved erosion threshold analysis and post-development land use modelling, the following target volume and release rate were established:

- Etobicoke Creek 325m³/impervious ha, released at 0.00031 m³/s/ha

The erosion control criteria for the subject site is summarized in **Table 2-1** and has been determined in the MW2 FSR. Detail calculations are provided in **Appendix A**.

Table 2-1: Erosion Control Criteria

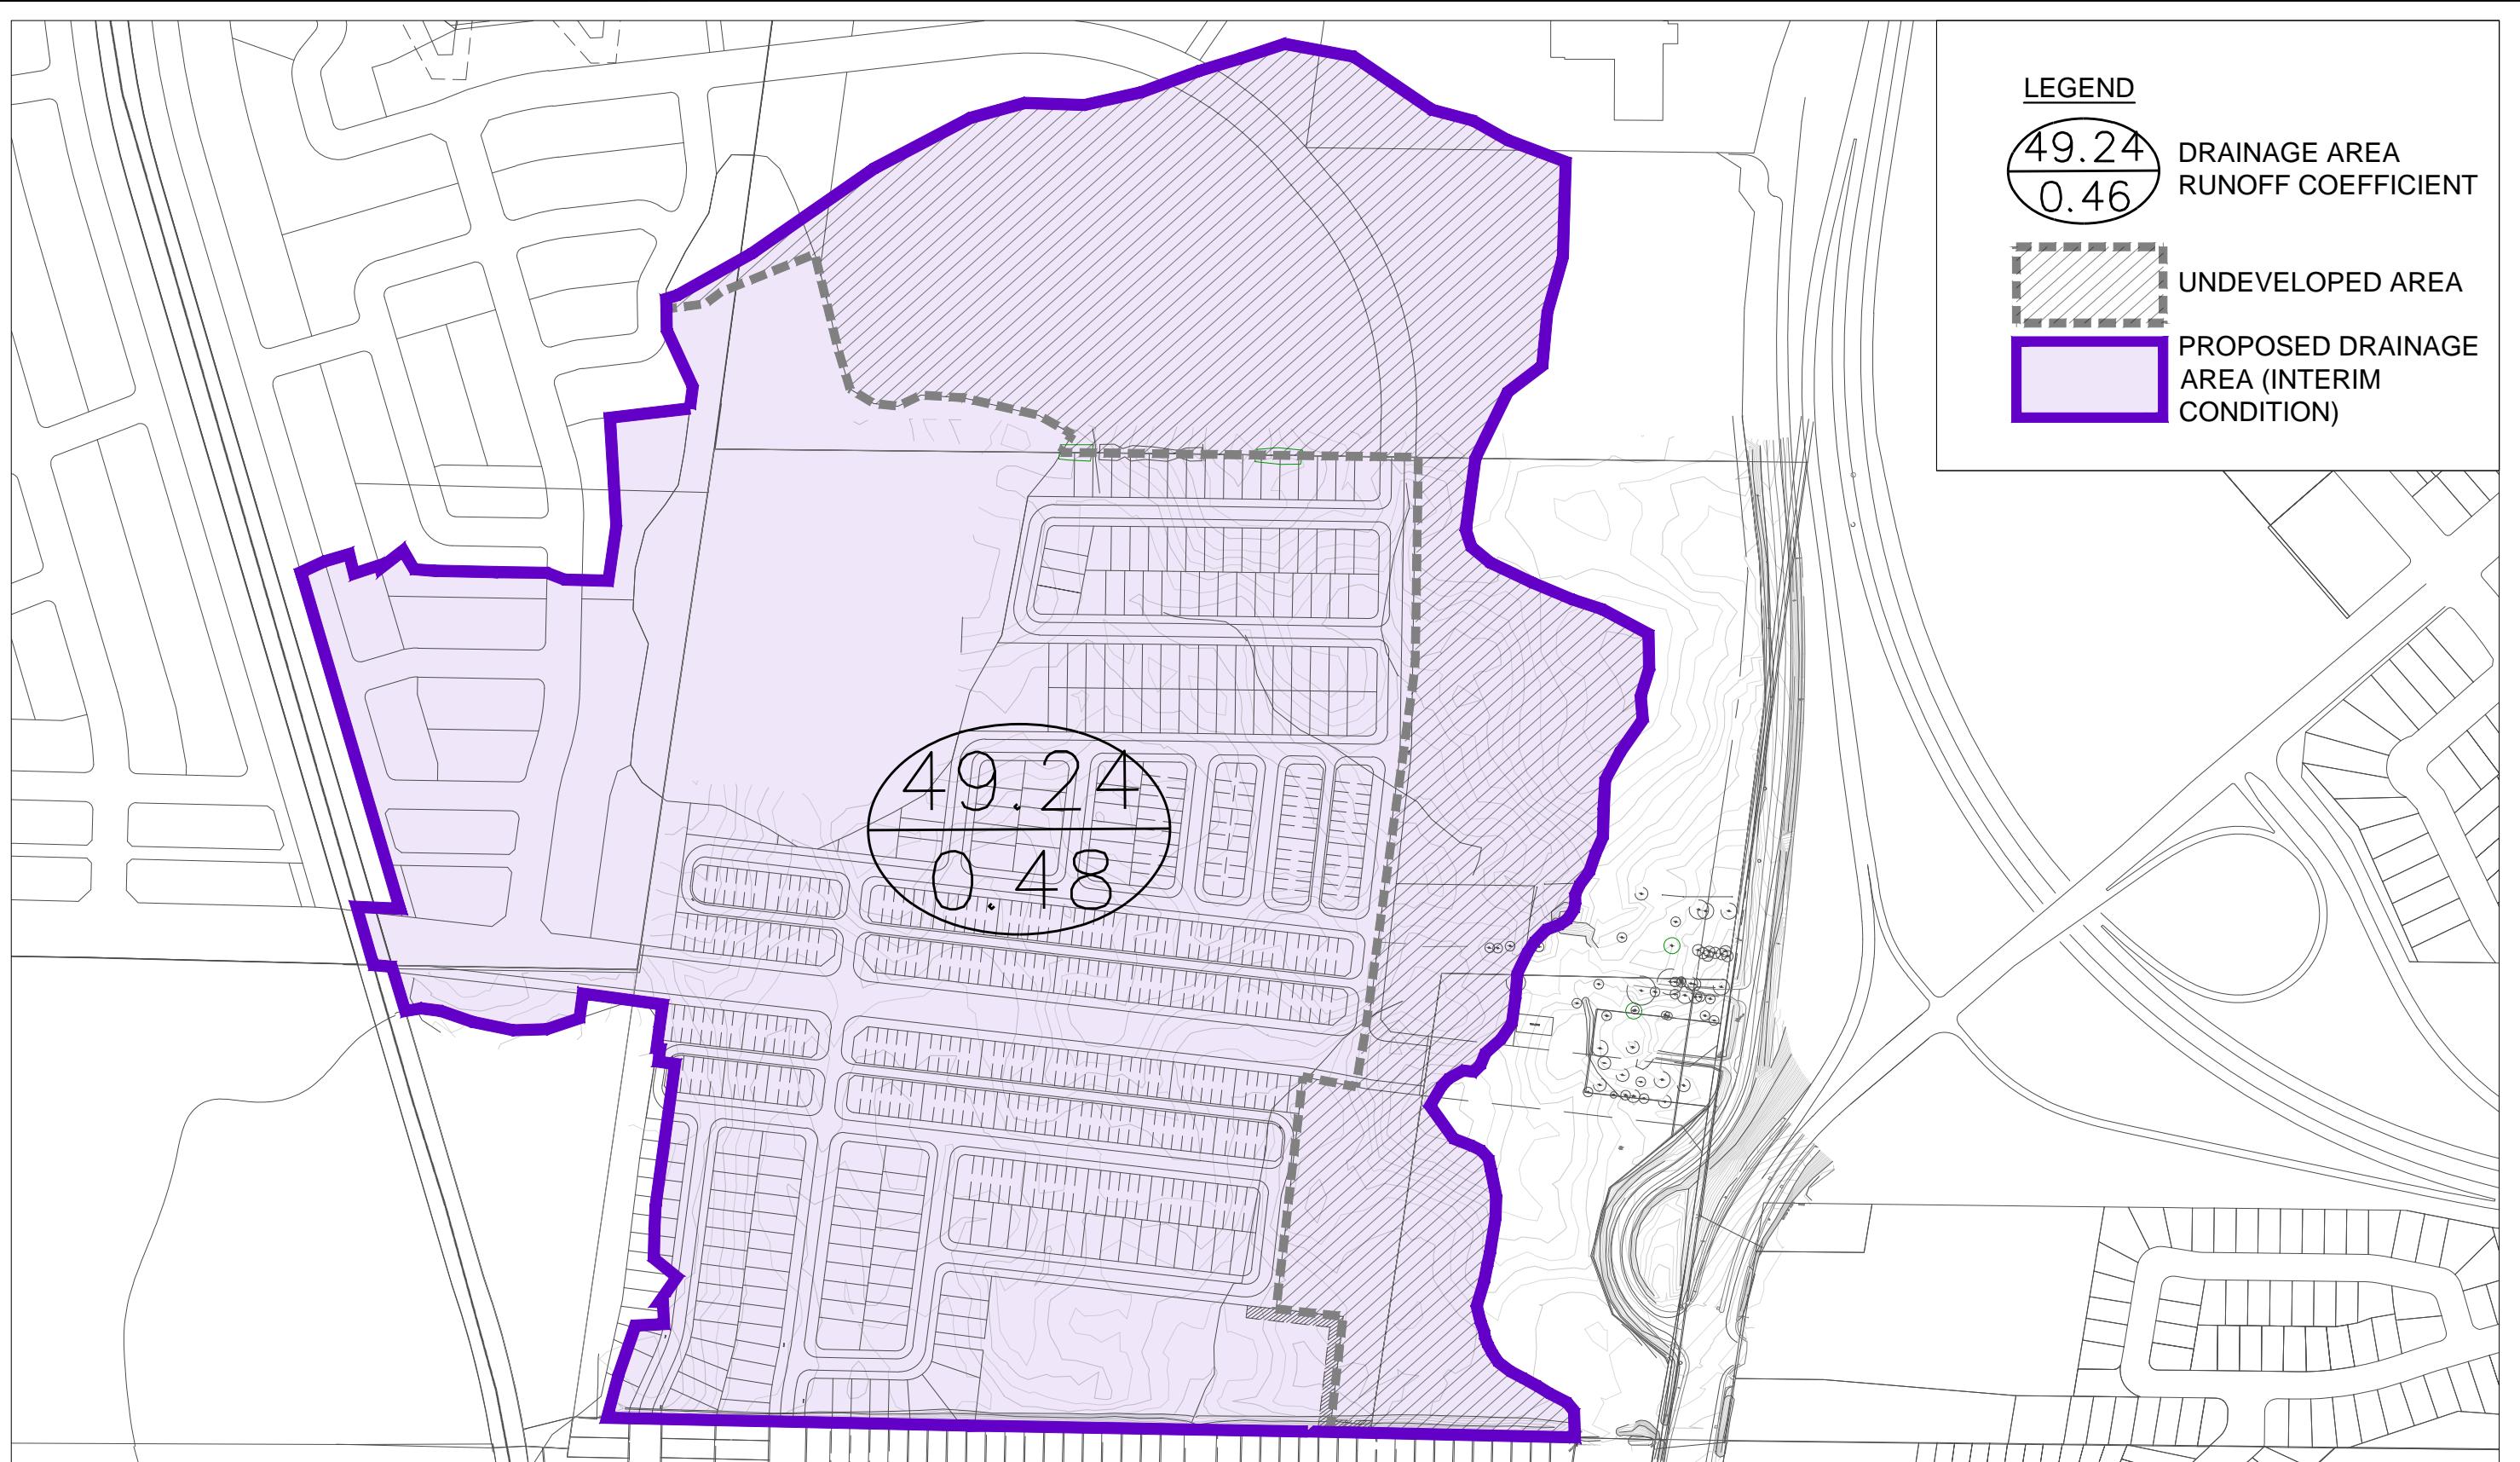

Scenario	Drainage Area	Imperviousness	Required Volume	Required Release Rate
Ultimate	48.12ha	68%	10,571 m ³	0.015m ³ /s
Interim	49.24ha	39%	6,290 m ³	0.015m ³ /s

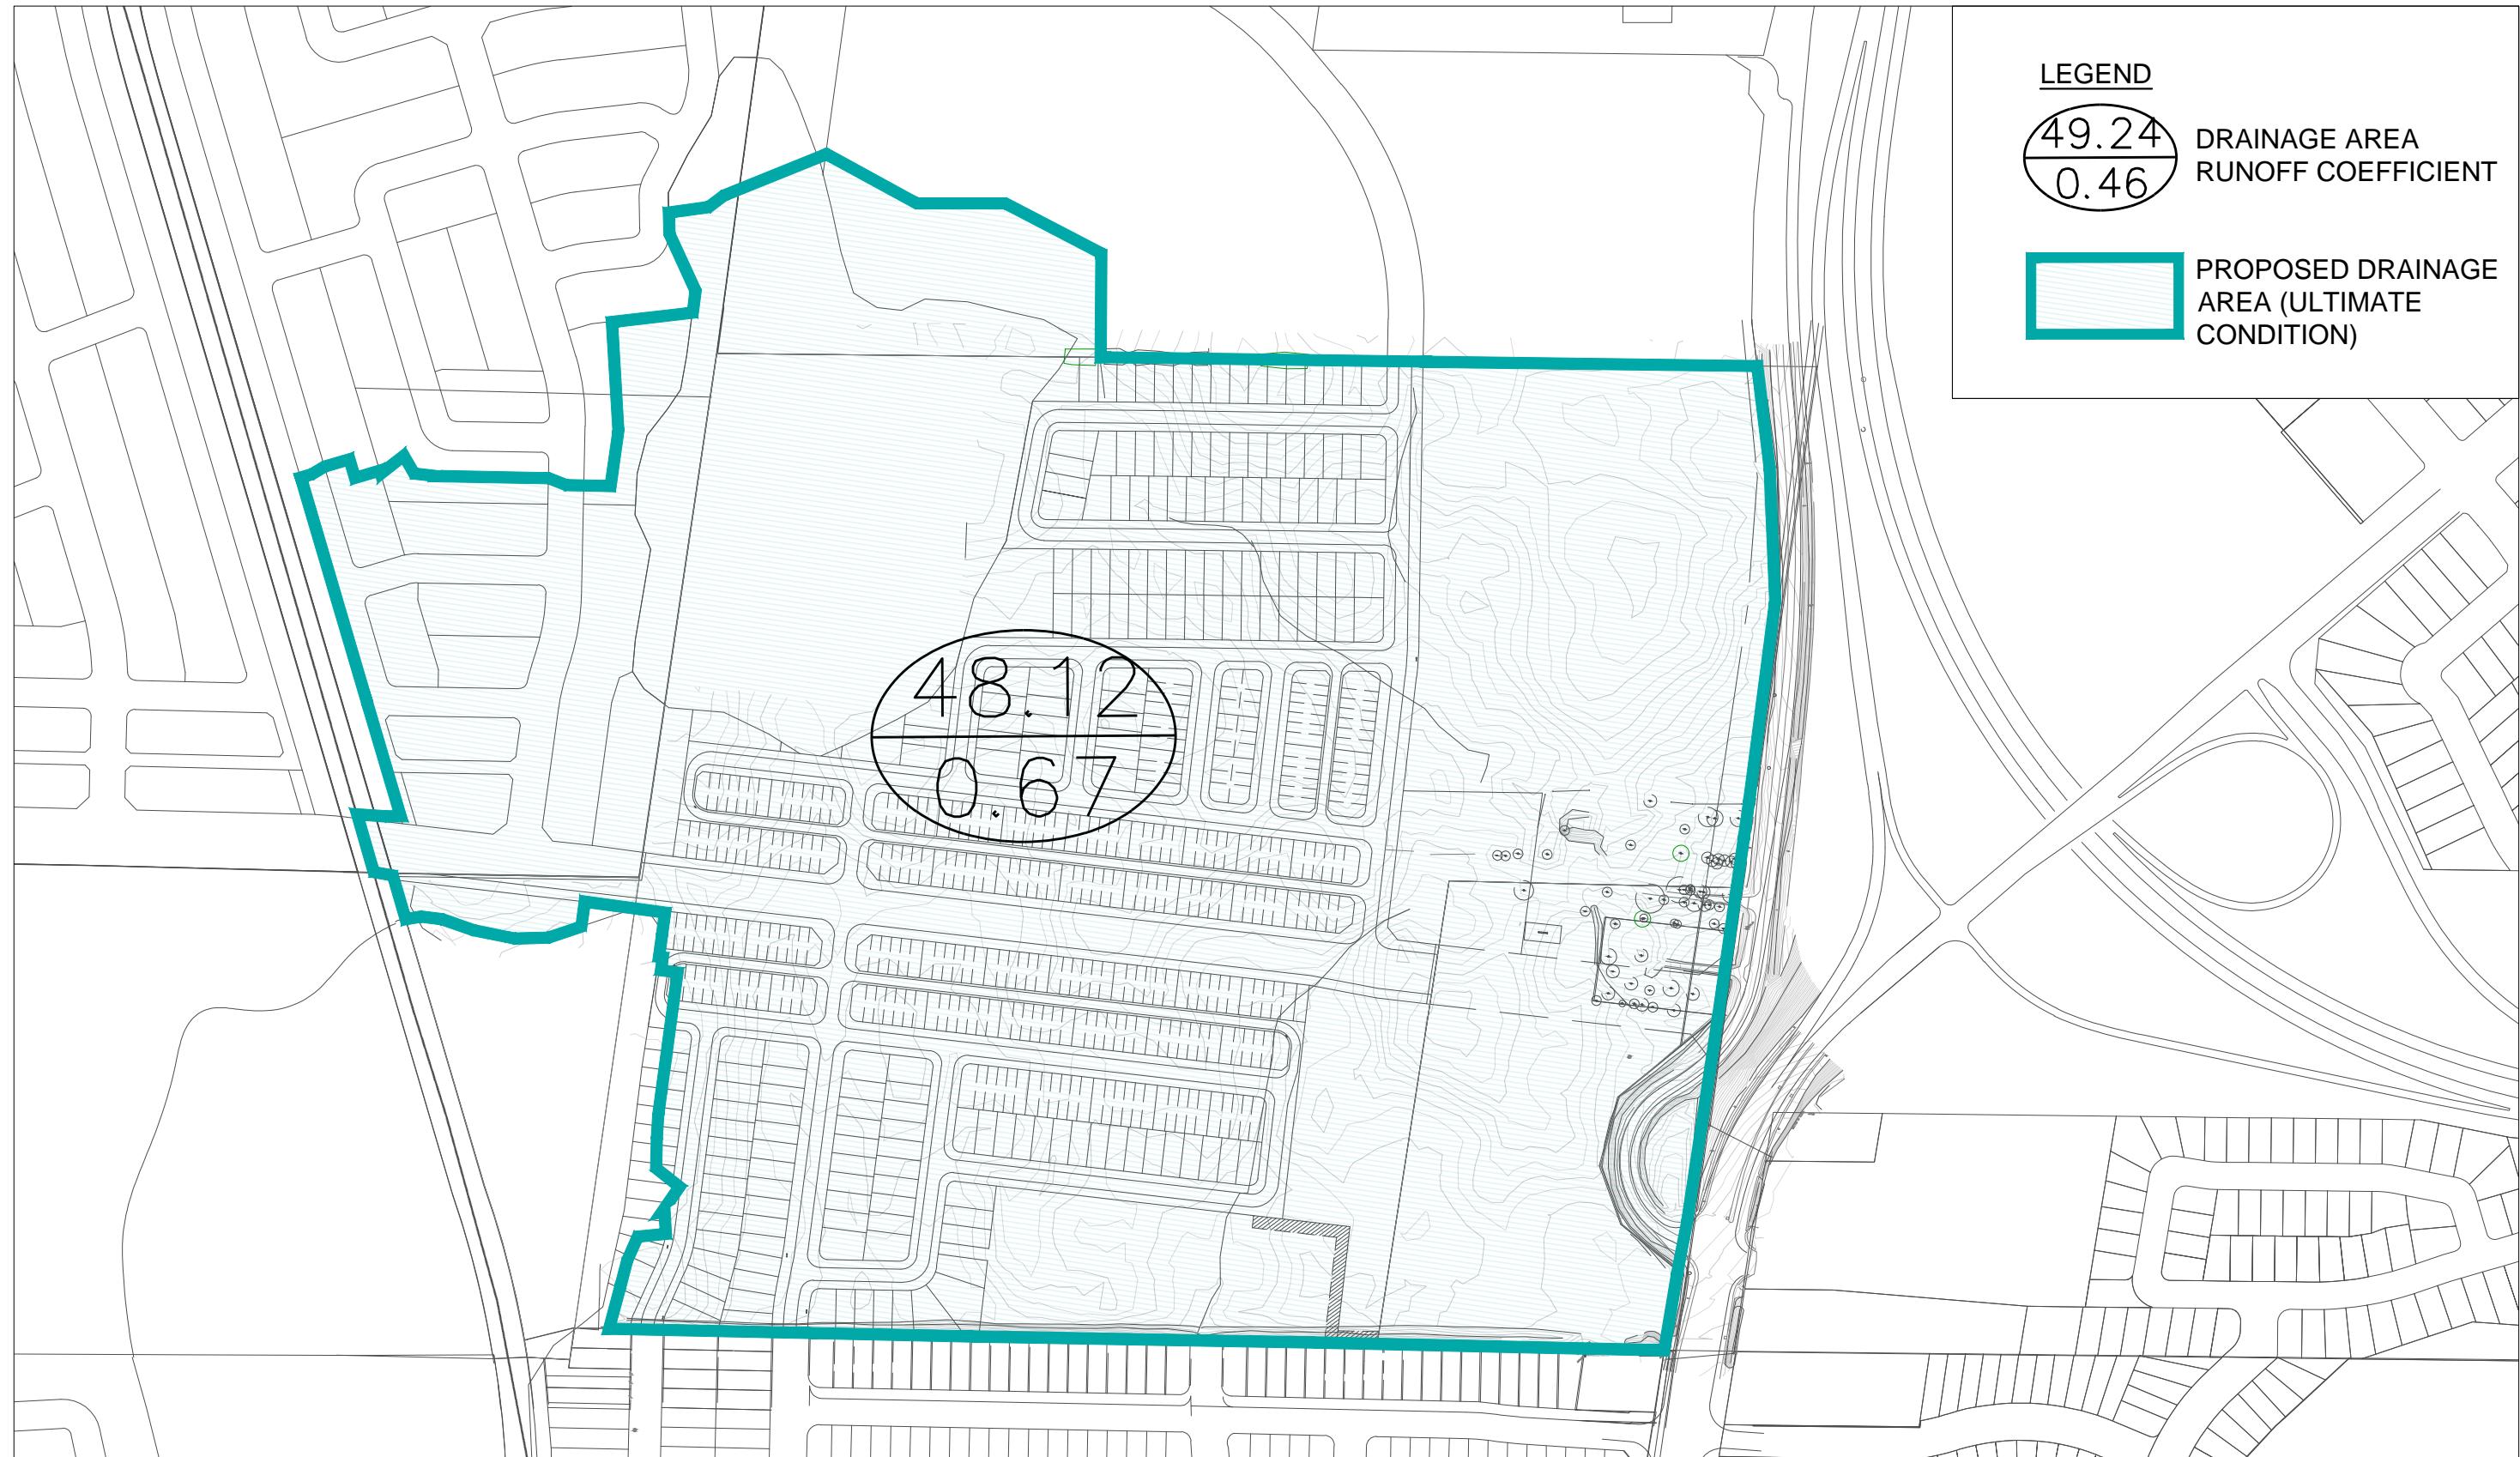

2.1.2 Water Quality Control Criteria

All ponds within the Etobicoke Creek Watershed must meet the Enhanced (Level 1) criteria as per the MOE SWM Planning and Design Manual (March 2003) Table 3.2, as shown below.

Table 3.2 Water Quality Storage Requirements based on Receiving Waters^{1, 2}

Protection Level	SWMP Type	Storage Volume (m ³ /ha) for Impervious Level			
		35%	55%	70%	85%
<i>Enhanced</i> 80% long-term S.S. removal	Infiltration	25	30	35	40
	Wetlands	80	105	120	140
	Hybrid Wet Pond/Wetland	110	150	175	195
	Wet Pond	140	190	225	250

DATE:	NOVEMBER 2017		
DESIGNED BY:	DRAWN BY:		
CHECKED BY:	CHECKED BY:		

FIGURE No.
2-2

The water quality control criteria for the subject site for wet pond is summarized in **Table 2-2**. Detail calculations are provided in **Appendix A**.

Table 2-2: Water Quality Control Criteria

Scenario	Drainage Area	Imperviousness	Required Volume
Ultimate	48.12ha	68%	8,438m ³
Interim	49.24ha	39%	5,537m ³

2.1.3 Water Quantity Control Criteria

Pond 9 Release rates are governed by capacity of the downstream storm sewer on Humberside Drive (approximately 2.22m³/s). Regional controls are not required for facilities discharging to Etobicoke Creek in accordance with the TRCA SWM criteria.

2.2 Preliminary SWM Pond Design

The proposed SWM Pond has been designed as an enhanced water quality wet pond servicing post-development flows from the subject site. The SWM pond has been designed to satisfy the required stormwater management criteria described in **Section 2.1**. Since the requirements for the ultimate condition is greater, the SWM pond has been sized based on the ultimate condition. Flows will inlet to the SWM Ponds through storm sewers and overland flow routes, with attenuated discharge draining to an existing storm sewer on Humberside Drive. Preliminary SWM Pond layout is shown on **Figure 2-3**.

Water quantity control will be provided to reduce the post-development release rates to the capacity of the downstream sewer on Humberside Drive (2.22m³/s). To determine the required attenuation storage volumes for the SWM ponds post-development storm runoff from the proposed development was modelled using the Visual OTTHYMO (VO) hydrologic model. The 2-year through 100-year return period events were simulated using the 12-hour AES design storms. Summaries of the expected storage volumes and release rates are presented in **Table 2-3**. The VO hydrologic model output files are provided in **Appendix A**.

The provided storage is based on the new SWM pond block which differs from the draft plan in the MW2 FSR. Detail calculations of the provided storage is provided in **Appendix A**.

Table 2-3: Summary of Expected Storage Volumes and Release Rates (12hr AES Storm)

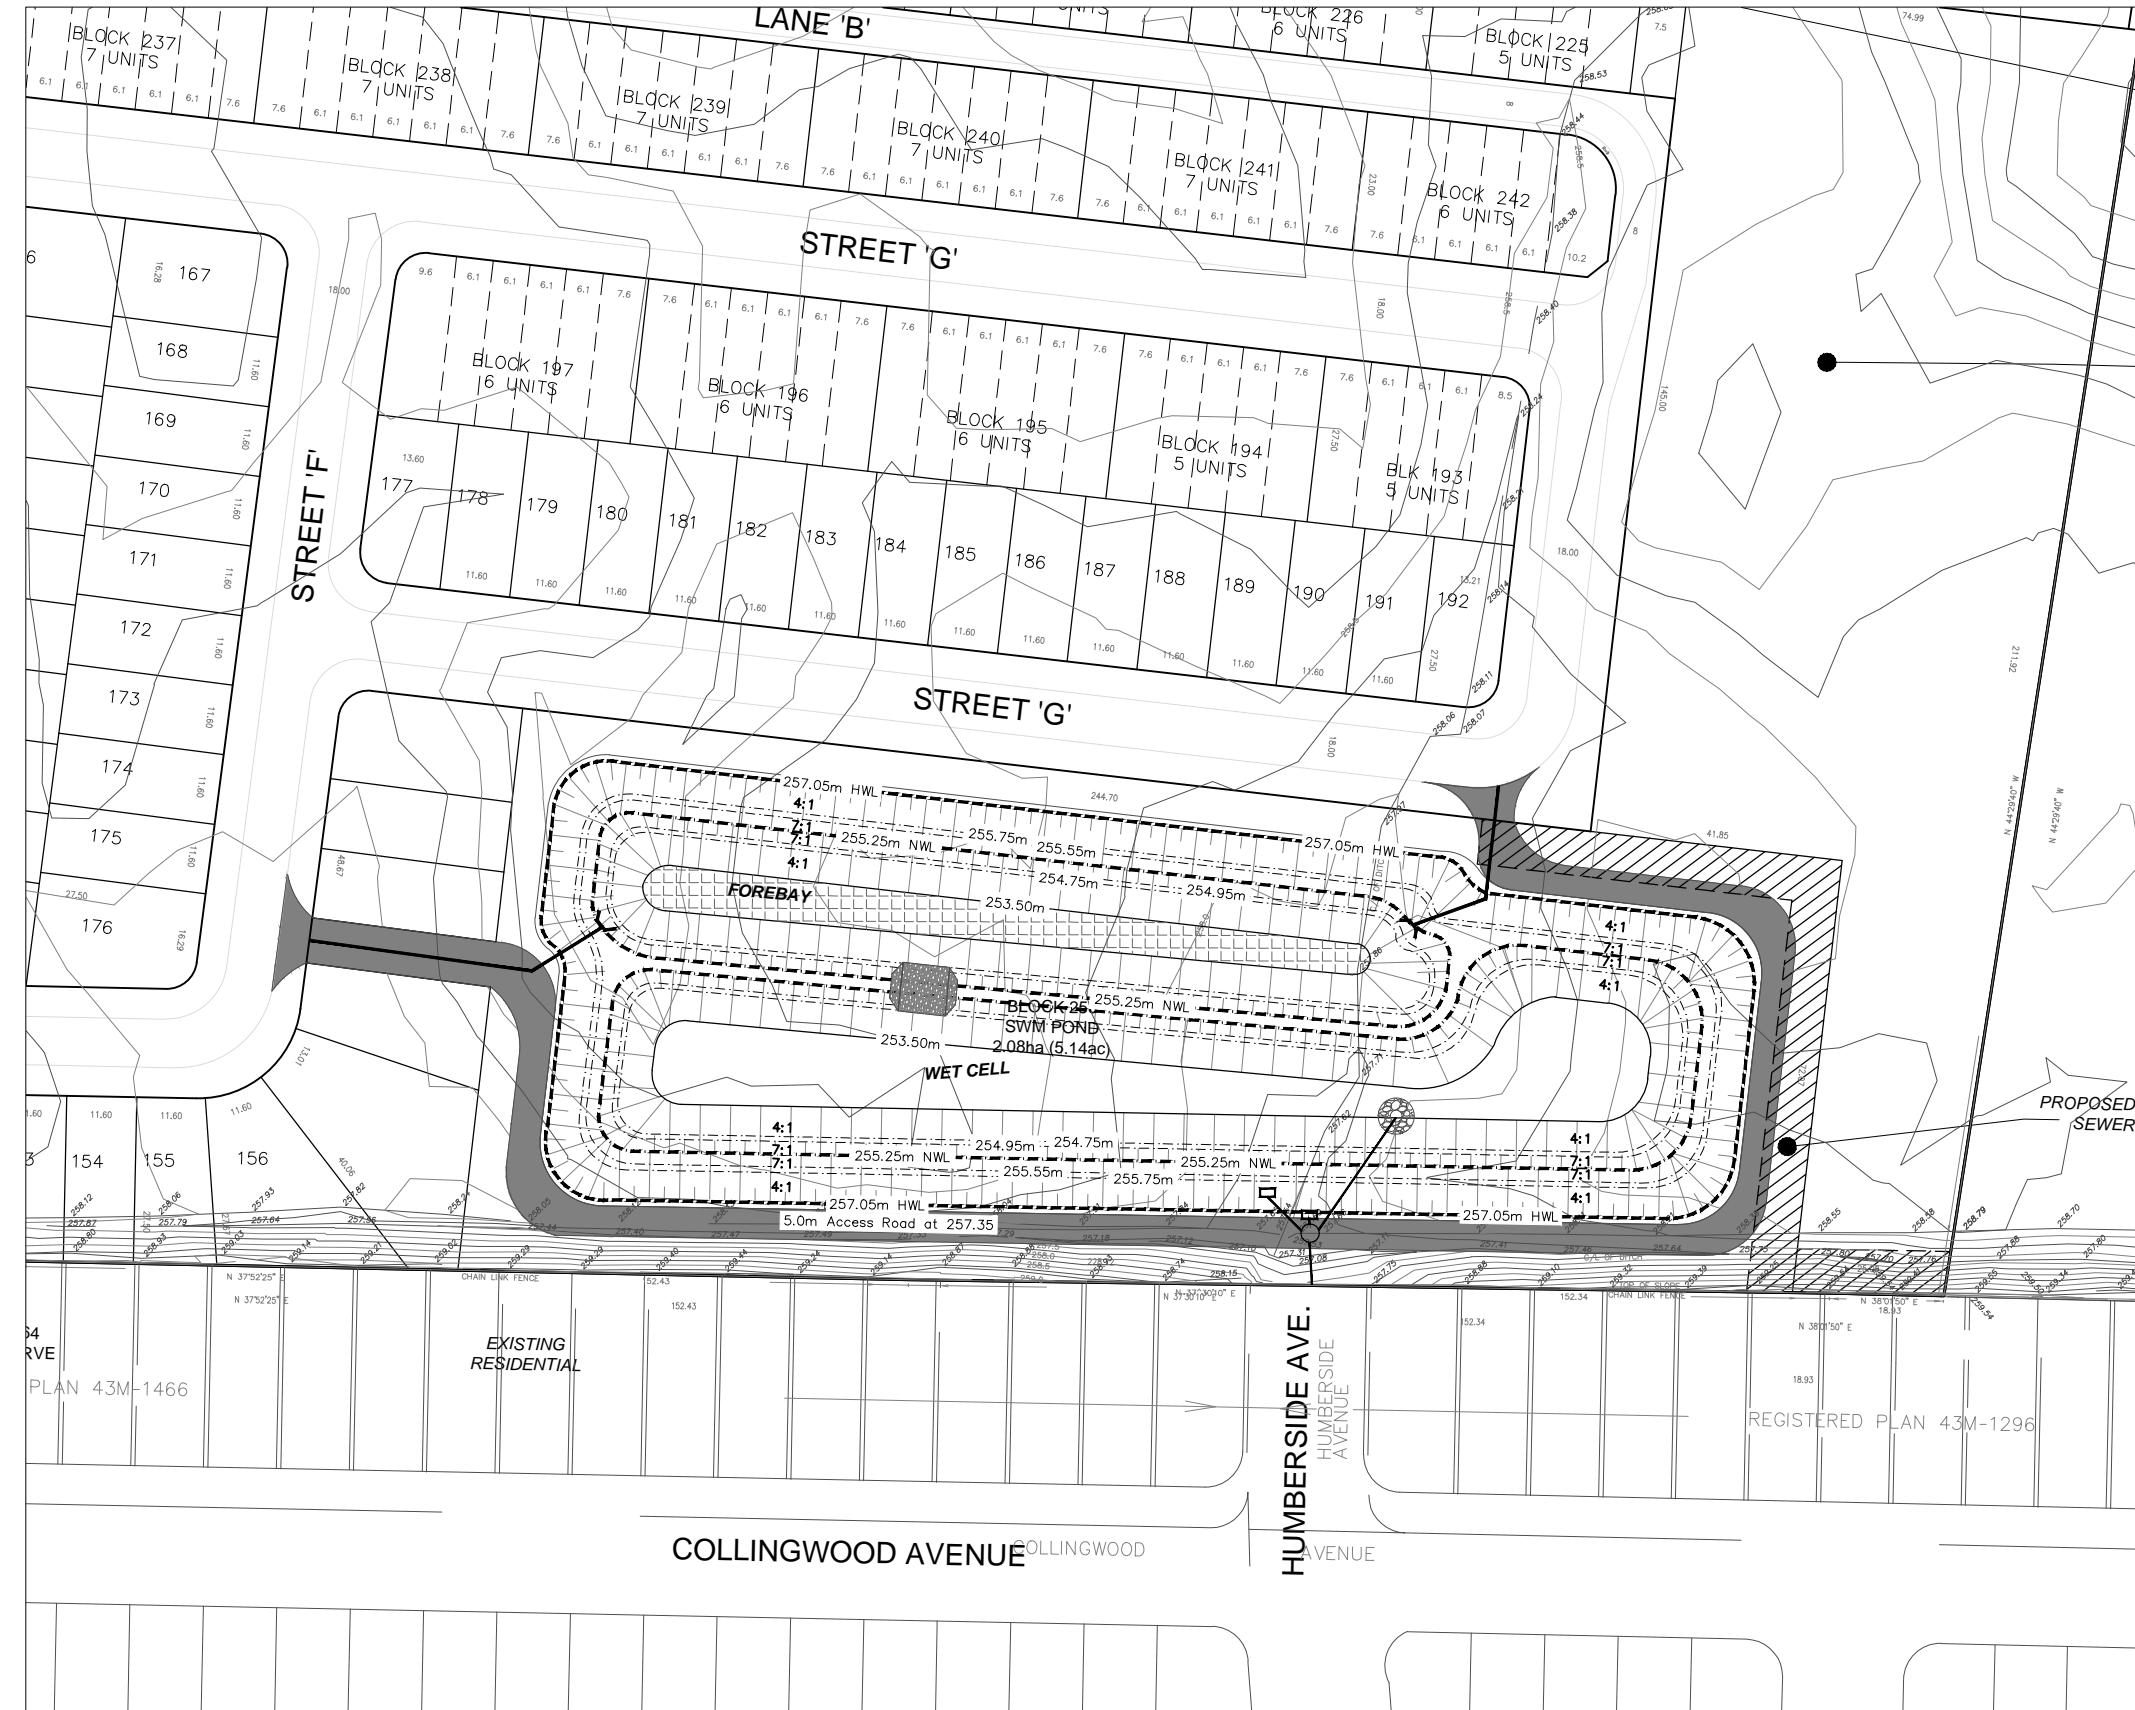

Component	Ultimate Condition		Interim Condition		Provide Storage (m ³)
	Peak Flow (m ³ /s)	Required Storage (m ³)	Peak Flow (m ³ /s)	Required Storage (m ³)	
Permanent Pool		8,438		5,537	8,643
Erosion Control	0.015	10,571	0.015	6,290	10,808
2-year	0.522	11,895	0.254	11,323	-
5-year	1.110	13,154	0.782	12,452	-
10-year	1.588	14,178	1.164	13,268	-
25-year	1.965	15,700	1.728	14,482	-
50-year	2.085	17,159	1.959	15,637	-
100-year	2.208	18,727	2.083	17,117	18,826

*Represents results from VO model output.

As shown on **Table 2-3**, the sufficient capacity is provided for both the ultimate and interim condition.

2.2.1 On-Site Control

The commercial property at the northeast corner of the Caledon 410 development is proposed to provide 42L/s/ha of on-site control prior to discharging into the SWM pond. On-site control may include but not limited to rooftop controls, surface storage over the parking area to a maximum of 0.3m, and underground storage. The entire 7.01ha of the commercial block is assumed to be controlled to a rate of 0.29m³/s.

DESCRIPTION	REQUIRED STORAGE	AVAILABLE STORAGE

2.3 Site Specific Water Balance

The water balance / recharge targets were established in the AMEC SWS modelling by examining the average annual infiltration volumes that occur under existing conditions. Due to varying soil types / land cover and flow characteristics, recharge targets were established by AMEC for each of the major catchment areas in the MW2 lands. The required infiltration volume for the associated drainage node 5.890 is 26,395m³ per year.

2.3.1 LID Measures

The lot level controls recommended in the MW2 FSR consisted of: rainwater harvesting, increased topsoil depth, roof downspout disconnections, rain gardens and dry swales. Additional geotechnical / hydrogeological studies are required prior to finalizing the selection of LID techniques in order to establish a realistic infiltration rate for potential LID locations. Given the low overall site infiltration rate, the expectation is that best efforts will be made to meet the targets established through the site specific studies.

2.4 Feature Based Water Balance

There are two environmental features that have been identified on the subject site which has been referred to as northeast and southeast (TRCA wetland) wetlands in the Urbantech MW2 FSR. The location of these wetlands are identified on **Figure 2-4**. The pre and post development drainage area identified in the MW2 FSR is summarized in **Table 2-4**.

Figure 2-4: Wetland Locations

Table 2-4: Pre and Post Development Feature Drainage Area

Wetland	Existing Drainage Area	Post Development Drainage Area
Northeast TRCA Wetland	6.82ha	7.35ha
Southeast TRCA Wetland	5.7ha	4.31ha

Groundwater and surface water monitoring for these wetlands were conducted by Terraprobe between 2011 and 2014. Based on the results of Terraprobe's analysis, PECG concluded that both TRCA wetlands are surface water fed wetlands since the results indicate a seasonal trend of wet and dry periods.

3 PROPOSED STORM SERVICING

3.1 Minor System

Internally within the development, drainage will be collected within a dual major/minor drainage network. The storm sewers within the proposed development will be designed to convey the runoff from a 5-year storm event and are designed as per the Town Standards. All storm sewer slopes, pipe cover depths and manholes meet the minimum design requirements of the Town. Runoff within this development will be conveyed to the Stormwater Management Pond within the proposed development area. The breakdown of drainage areas from these lands for to the pond is as noted in the following table.

Table 3-1 SWM Pond Tributary Areas- Ultimate Condition

Tributary Area (ha)	Comment
41.22	From this draft plan
6.90	External Area

Table 3-2 SWM Pond Tributary Areas- Interim Condition

Tributary Area (ha)	Comment
27.63	From this draft plan
21.61	External Area

The storm sewers have been designed such that a minimum ground cover of 1.50m is maintained above the sewers. The Caledon 410 FSR should be referenced for the proposed storm sewer layout and the storm design sheet.

3.2 Major System

Runoff from events greater than the 5-year event will be directed overland along the internal road network to the established low points adjacent to the proposed stormwater management pond. Overland flows will be directed via appropriately sized inlet conveyances into the pond.

The major system overland flow routes shall be designed to safely convey the 100 year peak overland flow into the facility and will be designed as per the Town Standards. The site has been graded to ensure positive drainage to the intended major system outlet such that the depth of ponding under 100 year event does not exceed 0.3m.

4 CONCLUSION

This Stormwater Management Report presents the stormwater management plan for the Caledon 410 Development within the Mayfield West Phase 2 Secondary Plan Area, Town of Caledon.

A summary of our findings are as follows;

- Appropriate stormwater management measures will be provided to satisfy the applicable water quality treatment and quantity attenuation criteria.
- The storm sewer network within the proposed development will be designed to convey runoff from a 5-year storm event.

The SWM report is a functional level of design and it is noted that the detailed design will be supported by the Environmental Impact Study (EIS), hydrogeology and geotechnical studies in order to further refine the proposed Stormwater Management (SWM) pond design.

We trust you will find the contents of this report satisfactory. Should you have any questions or comments please do not hesitate to contact the undersigned.
