# **Environmental Noise Study**

## **13291 Airport Road**

### **Proposed Industrial Development**

Caledon, Ontario

#### **EXECUTIVE SUMMARY**

Valcoustics Canada Ltd. (VCL) was retained to prepare an Environmental Noise Study in support of the Temporary Zoning By-law Amendment (ZBA) application submission to the Town of Caledon. The proposed development is a temporary truck and trailer storage facility.

The sound levels at the neighbouring noise-sensitive receptors due to activities on the site have been determined and compared with the applicable Ministry of the Environment, Conservation and Parks (MECP) guideline limits to determine the need for noise mitigation.

The main noise sources associated with the proposed development with the potential to create noise impact at the neighbouring receptors are the truck movements on site and trailer coupling/uncoupling in the parking area.

The analysis shows that a 3.0 m high sound barrier is required along the west side of the westernmost parking spaces to meet the noise guideline limits at the neighbouring receptors. The location of the sound barrier is shown on Figure 6.

#### **1.0 INTRODUCTION**

VCL was retained to prepare an Environmental Noise Study in support of the Temporary Zoning By-law Amendment (ZBA) application submission to the Town of Caledon. The potential sound levels and noise mitigation measures needed for the proposed development to comply with the MECP noise guideline requirements are outlined herein.

#### **1.1 SITE LOCATION AND SURROUNDING AREA**

The proposed trailer storage facility is located at 13291 Airport Road in the Town of Caledon.

The site is bounded by:

- An existing residential dwelling and agricultural land to the north;
- Agricultural land with residential dwellings beyond to the east;
- Agricultural land, with existing trucking facilities beyond, to the south; and
- Airport Road and existing residential dwellings to the west.

There is an existing dwelling on site that will be demolished as part of the new development.

A Key Plan is included as Figure 1.

The analysis was done using the Temporary Use Site Plan, prepared by Humphries Planning Group Inc., dated March 21, 2025. The Temporary Use Site Plan is included as Figure 2.

## **1.2 THE PROPOSED DEVELOPMENT**

The proposed development will consist of 677 truck and trailer parking spaces. Trucks will access the site using a driveway from Airport Road.

## **2.0 ENVIRONMENTAL NOISE GUIDELINES - STATIONARY SOURCES**

A stationary source is a source of sound or a combination of sources of sound that are included and normally operated using the property lines of a facility. The applicable noise guideline for this development is MECP Publication NPC-300. The guideline presents limits on the sound emissions from the stationary source. The limits are receptor based meaning they are applicable at noise sensitive land uses, such as the residential dwellings to the west, and not at the facility itself.

### **2.1 NON-IMPULSE (STEADY) NOISE SOURCES**

The site and lands around the site are Class 1 which is an area where the ambient sound environment is dominated by “urban hum”, primarily traffic noise in this case, 24 hours per day. This is due to the proximity to Airport Road.

The MECP requires a predictable “worst case” one-hour operating scenario be analysed. This would occur when the difference between the background ambient sound level or the guideline limit and the noise generated by the stationary noise sources is greatest. The predictable worst case is not the absolute worst-case operation that could occur on a site but is “a planned and predictable mode of operation”.

The guideline limits apply at the outdoor plane of window of habitable spaces such as living/dining/family rooms and sleep areas (at all times) as well as at locations amenable for use outdoors (during the daytime and evening). There are no indoor sound level limits provided for stationary sources.

MECP Publication NPC-300 states that the guideline limits are the higher of the ambient sound level, due to road traffic noise, or the minimum exclusion limits, in any hour of the day or night. For a Class 1 Area such as this, the minimum exclusion limits (summarized in Table 1A) are 50 dBA during the daytime (0700 to 1900 hours) and evening (1900 to 2300 hours) and 45 dBA at night (2300 to 0700 hours). Sound levels are assessed using the one-hour energy equivalent continuous sound level ( $L_{eq\ 1hr}$ ) in A-weighted decibels (dBA).

## **2.2 IMPULSIVE SOURCES**

Impulsive sound is a category of sound which lasts for a brief time (typically fractions of one second). Examples are the sounds of banging of metal, punch presses or gunshots. The “banging” sound that can occur when trailers are coupled/uncoupled from the cabs are also classified as impulsive.

Impulse sounds are measured and treated separately because of their special time characteristics. The stationary source sound level criteria are expressed using the  $L_{LM}$  (logarithmic mean impulse) descriptor. The  $L_{LM}$  descriptor is the energy (logarithmic) average of the range of impulse sound levels impinging on a receptor. Because of the logarithmic relationship involved,  $L_{LM}$  is weighted to the higher values and is quite unlike an arithmetic average which would yield a much lower numerical result for a wide range of values.

The sound level limits vary depending on the number of impulses occurring in the worst-case hour. The minimum exclusion limits for impulsive sources in a Class 1 area are summarized in Table 1B.

## **2.3 APPLICABLE GUIDELINE LIMITS**

Due to the proximity of Airport Road, the noise guideline limits at the receptors (dwellings) in the vicinity are defined by ambient road traffic noise.

Details of the ambient sound level calculations are discussed in Section 5.0.

## **3.0 FACILITY OPERATIONS**

Giampaolo Developments has provided the following information regarding operations at the facility:

- The facility will be open 24-hours per day with trucks arriving or departing during the daytime, evening and nighttime hours.
- Typically, drivers are expected to arrive on site in a personal vehicle in the morning, pick up their trucks, complete their deliveries, return their trucks to site, and then depart in their personal vehicles.
- Trailers may be coupled/uncoupled from their cabs as needed.
- Truck activity will be spread evenly across the parking area.
- Refrigerated trucks may use the facility (could be 10% of the total truck volume). However, the refrigeration units will not operate while on site.
- The hourly truck volumes expected at the subject site are not available. However, operating information was provided for a similar facility that is approximately half the size of the subject facility. At the other facility, 60 trucks would be inbound and 60 cars would outbound, and 60 cars would be inbound and 60 trucks would be outbound over the busiest 12-hour period.

Based on the information provided, we have applied these assumptions to develop a predictable worst-case operating scenario:

- Truck activity primarily occurs during the early morning (when the trucks depart) and the late afternoon/evening (when the trucks return).
- The truck traffic on site would be approximately double the traffic that occurs at the smaller facility described above. That is, 120 trucks would be inbound and 120 cars would outbound, and 120 cars would be inbound and 120 trucks would be outbound over the busiest 12-hour period.
- During the busiest early morning hour (assumed to be 0600 to 0700), 60 trucks could depart the site. During the busiest afternoon/evening hour, 60 trucks could arrive back at the site. It is noted that these are truck volumes are conservative assumptions used for the purpose of this assessment.
- Each truck idles its engine in the parking area for approximately 5 minutes (to account for warm up and or manoeuvring).
- Trucks travel at 20 km/h while on site.
- Impulse sounds are generated when trailers are coupled/uncoupled from the truck cabs. The impulses will be frequent (i.e., there will be at least 10 impulses in the busiest hour).

The source ID's are summarized in Table 2. The source locations are shown on Figures 3A and 3B.

## 4.0 ANALYSIS METHOD

A 3-D acoustic model of the proposed facility, as shown on Figures 4 to 6, was developed to predict the potential sound levels at the residential points of reception from the truck movements and activity at the trailer parking areas. The model was developed using the CadnaA v2024 MR1 environmental noise modelling software, which implements the protocols of ISO Standard 9613-2, "Acoustics – Attenuation of Sound During Propagation Outdoors (1996)". Two orders of sound reflection were included in the analysis. The area surrounding the subject site is primarily grass and agricultural land, which was modelled as absorptive ground ( $G = 1.0$ ). The trailer parking area and Airport Road were modelled as a reflective surface ( $G = 0.0$ ). This is conservative, as the parking surface is intended to be gravel, and no screening/interference from trailers on site was included in the assessment.

## 5.0 AMBIENT SOUND LEVEL CALCULATIONS

The ambient sound levels due to road traffic (i.e. the applicable guideline limits if higher than the minimum exclusion limits) were calculated using the RLS-90 road traffic noise model included in the CadnaA software package. (Note, RLS-90 was confirmed to predict similar sound levels as ORNAMENT, the MECP traffic noise prediction model, at a sample receptor location. See Appendix C.)

A 6-hour turning movement count (TMC) for Airport Road at Old School Road, completed in March 2025, was provided by the traffic consultant for this project (see Appendix B). The data shows that the hourly traffic volumes on Airport Road, north of Old School Road, were:

- 0700 to 0800: 630 vehicles
- 0800 to 0900: 535 vehicles
- 0900 to 1000: 423 vehicles
- 1500 to 1600: 569 vehicles
- 1600 to 1700: 632 vehicles
- 1700 to 1800: 578 vehicles

The truck activities at the subject facility would likely follow the general traffic pattern in the area. That is, the morning peak would likely occur around 0700 and the afternoon peak would likely occur around 1600.

However, to be conservative, the ambient sound levels were calculated using these assumptions:

- The morning peak activity (i.e., 60 cars in and 60 trucks out) on the subject site would occur between 0600 to 0700, i.e. before the traffic on Airport Road reaches its peak.
- The background traffic volume on Airport Road between 0600 and 0700 was taken to be 423 vehicles, which is the minimum volume that occurs during the morning hours reported in the TMC.
- The afternoon peak activity (i.e., 60 trucks in and 60 cars out) on the subject site would occur between 1600 and 1700 hours (i.e., the afternoon hour when the highest background traffic occurs on Airport Road according to the TMC).
- The same hourly background traffic volume of 423 vehicles was used to calculate the ambient sound level from Airport Road during the busiest on-site afternoon hour (1600 to 1700) when the vehicles return to site. (It is noted that the traffic volumes in the afternoon count period were all higher and the assumed volume of 423 is therefore conservative since it underpredicts the ambient sound level during the afternoon period.)

Since the same volume was used to represent the background traffic volume in the peak morning and afternoon/evening hours, the calculated ambient sound level is the same for both scenarios. The ambient sound levels are shown on Figure 3. Similarly, since the same peak hour activity at the site was assumed to be the same for the peak morning and afternoon/evening hours, the calculated sound levels shown on Figure 5 from the on-site activities are the same for both periods.

## 6.0 RECEPTOR LOCATIONS

These points of reception were assessed:

- POW\_01 to POW\_03 – representing the ground-floor plane of windows on the east sides of the single-storey dwellings to the west of the development, on the east side of Airport Road;
- OPOR\_01 to OPOR\_3 – representing the rear yards of the single-storey dwellings to the west of the development, on the east side of Airport Road.
- POW\_4 – representing the second-storey plane of windows on east side of the two-storey dwelling to the west of the development, on the west side of Airport Road.

Receptors representing the ground-floor and second-storey plane of windows were assessed at heights of 2.5 m and 4.5 m above grade, respectively. Receptors representing the outdoor points of reception were assessed at a height of 1.5 above grade.

## 7.0 MODELLED SCENARIOS

As indicated above, one peak hour operating scenario was modelled for the peak morning and afternoon/evening time periods. Note that the peak morning activity is assumed to occur during the nighttime period (0600 to 0700) as defined in NPC-300. The peak hour operating scenario was assumed to be:

- 60 truck entering or leaving the site; and
- 60 trucks each idling for 5 minutes per hour in the trailer parking area.

One impulse source scenario of 9 or more (i.e., frequent) trailer coupling/uncoupling events occurring throughout the trailer parking area was modelled to represent the same peak hours described above.

## 8.0 PREDICTED SOUND LEVELS

Figure 5 and Table 4 summarize the predicted unmitigated sound levels at the assessment receptors for the non-impulse and impulse source scenarios.

As shown on the figures and tables, excesses up to 2 dBA and 4 dBAL are predicted to occur in the impulse and non-impulse scenarios, respectively. The highest sound levels are predicted to occur at POR\_2 and POW\_3 which are the rear façades of the dwelling closest to the trailer storage area. Mitigation measures have therefore been investigated.

## 9.0 MITIGATION

The sound levels can be mitigated to the applicable guideline limits using a 3.0 m high sound barrier along the west side of the westernmost trailer parking spaces. The location of the sound barrier is shown in Figure 6.

It is noted that, although the unmitigated sound levels due the trailer coupling/uncoupling activities are within the guideline limits, this sound barrier will also reduce the noise impact from these sources.

The sound barrier must be of solid construction with no gaps, cracks or holes and must have a minimum surface density of 20 kg/m<sup>2</sup>. A variety of materials can be used, including wood, earthen berms, or a combination of the above. Given that the trailer parking area will be a temporary use, other materials, such as hay bales, seacans or trailers that will not be removed from the site, could also be used, provided they meet the above listed requirements for a sound barrier.

## **10.0 CONCLUSIONS**

With the incorporation of the recommended mitigation measures, it is expected the applicable MECP noise guidelines can be met at the neighbouring noise sensitive receptors.

The approvals and administrative procedures are available to ensure that the noise requirements are implemented.

### **SAMPLE ORNAMENT CALCULATION**

STAMSON 5.04 NORMAL REPORT Date: 07-04-2025 15:34:48  
MINISTRY OF ENVIRONMENT CONSERVATION AND PARKS / NOISE ASSESSMENT

Filename: pow\_4.te Time Period: 1 hours  
Description: Ambient calculation at POW\_4

Road data, segment # 1: Airport Rd

-----  
Car traffic volume : 377 veh/TimePeriod  
Medium truck volume : 18 veh/TimePeriod  
Heavy truck volume : 28 veh/TimePeriod  
Posted speed limit : 80 km/h  
Road gradient : 0 %  
Road pavement : 1 (Typical asphalt or concrete)

Data for Segment # 1: Airport Rd

-----  
Angle1 Angle2 : -90.00 deg 90.00 deg  
Wood depth : 0 (No woods.)  
No of house rows : 0  
Surface : 1 (Absorptive ground surface)  
Receiver source distance : 58.00 m  
Receiver height : 4.50 m  
Topography : 1 (Flat/gentle slope; no barrier)  
Reference angle : 0.00

Results segment # 1: Airport Rd

-----  
Source height = 1.60 m

ROAD (0.00 + 59.16 + 0.00) = 59.16 dBA  
Angle1 Angle2 Alpha RefLeq P.Adj D.Adj F.Adj W.Adj H.Adj B.Adj SubLeq
