To the extent that this report is based on information supplied by other parties, Paradigm Transportation Solutions Limited accepts no liability for any loss or damage suffered by the client, whether through contract or tort, stemming from any conclusions based on data supplied by parties other than Paradigm Transportation Solutions Limited and used by Paradigm Transportation Solutions Limited in preparing this report.

# Executive Summary

## Content

Wyndham Holdings has retained Paradigm Transportation Solutions Limited (Paradigm) to conduct this Transportation Impact Study (TIS) for a proposed retirement home located at 15728 Airport Road in the Town of Caledon.

This study determines the impacts of the development traffic on the surrounding road network, identifies the recommended improvements to accommodate the site generated traffic, and recommends Transportation Demand Management (TDM) measures to mitigate the subject site's transportation and parking impacts.

## Development Concept

The subject site is located at 15728 Airport Road in the Town of Caledon. The proposed Retirement Home is expected to consist of up to 150 beds in 127 units. Build-out is anticipated to occur by the end of Year 2026.

Vehicle access to the site is proposed by a single right-in, right-out, and left-in driveway to Airport Road located approximately 80 metres south of the Caledon East Public School Driveway.

## Conclusions

The main findings and conclusions of this study are as follows:

- ▶ **Existing Traffic:** The study area intersections are operating with acceptable levels of service during the weekday AM and PM peak hours. No critical movements are occurring at the study area intersections.
- ▶ **Planned Improvements:** The Region of Peel is currently undertaking an Environmental Assessment (EA) for Airport Road. At the time of writing, the EA is not yet finalized. For analysis purposes, geometric and traffic control improvements are assumed to be in place for the study area intersections.
- ▶ **Trip Generation:** The site's net trip generation is estimated to be approximately 29 AM peak hour vehicle trips and 39 PM peak hour vehicle trips. Vehicle access to the site is proposed by a driveway connection to Airport Road and left-turns out of the driveway are assumed to be restricted by a raised centre median on Airport Road.

- ▶ **Heavy Vehicle Circulation:** Pending the final lane configuration from the Airport Road EA, modifications to the curb radii and/or entrance width may be required to accommodate the design vehicle to enter and exit the site without impacting the opposing travel lane.  
  
The reversing maneuvers into the site's loading zone should ideally be assisted by a traffic control person.
- ▶ **Background Traffic:** The study area intersections are generally operating with acceptable levels of service, with the exception of the westbound movement at the Airport Road and Cranston Drive intersection which is forecast to operate at LOS E with a  $v/c < 0.50$  during the AM peak hour in the 10-year horizon.
- ▶ **Total Traffic:** The study area intersections are forecast to operate with similar levels of service as the background traffic conditions. No additional critical movements are noted at the study area intersections over background conditions. The site driveway is forecast to operate with delays in the LOS A to B range with  $v/c$  ratios of less than 0.05.
- ▶ **Remedial Measures:** No changes to the existing lane configurations are warranted or required. It is noted that the Airport Road EA may recommend changes in intersection traffic control that is not discussed in this study.
- ▶ **Transportation Demand Management:** Enhancements to the on-site pedestrian realm, inclusion of bicycle parking and preferential carpool parking will help promote sustainable modes of travel and further mitigate the site's transportation impacts.

## Recommendations

Based on the findings of this study, it is recommended that:

- ▶ The Region of Peel monitor the outcome of the Airport Road EA to determine if modifications to the curb radii and/or entrance width are required to the proposed driveway; and
- ▶ The site operator manages deliveries and waste collection to minimize on-site disruptions. Reversing maneuvers into the site's loading zone should ideally be assisted by a traffic control person.

# 1 Introduction

## 1.1 Overview

Wyndham Holdings has retained Paradigm Transportation Solutions Limited (Paradigm) to conduct this Transportation Impact Study (TIS) for a proposed retirement home located at 15728 Airport Road in the Town of Caledon. **Figure 1.1** illustrates the location of the subject site.

The scope of the study includes:

- ▶ Determine and assess the current study area traffic conditions;
- ▶ Forecast the additional traffic generated by the proposed development;
- ▶ Assess the site's circulation of delivery and waste collection vehicles;
- ▶ Analyze the impacts of the additional traffic on the study area street network;
- ▶ Review Transportation Demand Management (TDM) strategies; and
- ▶ Recommend any necessary remedial measures to mitigate the traffic impacts.

The study scope was developed in consultation with the Region of Peel in February 2020. **Appendix A** contains the pre-study consultation material. This study has been prepared in accordance with the Region's Traffic Impact Study Guidelines<sup>1</sup>.

## 1.2 Study Area

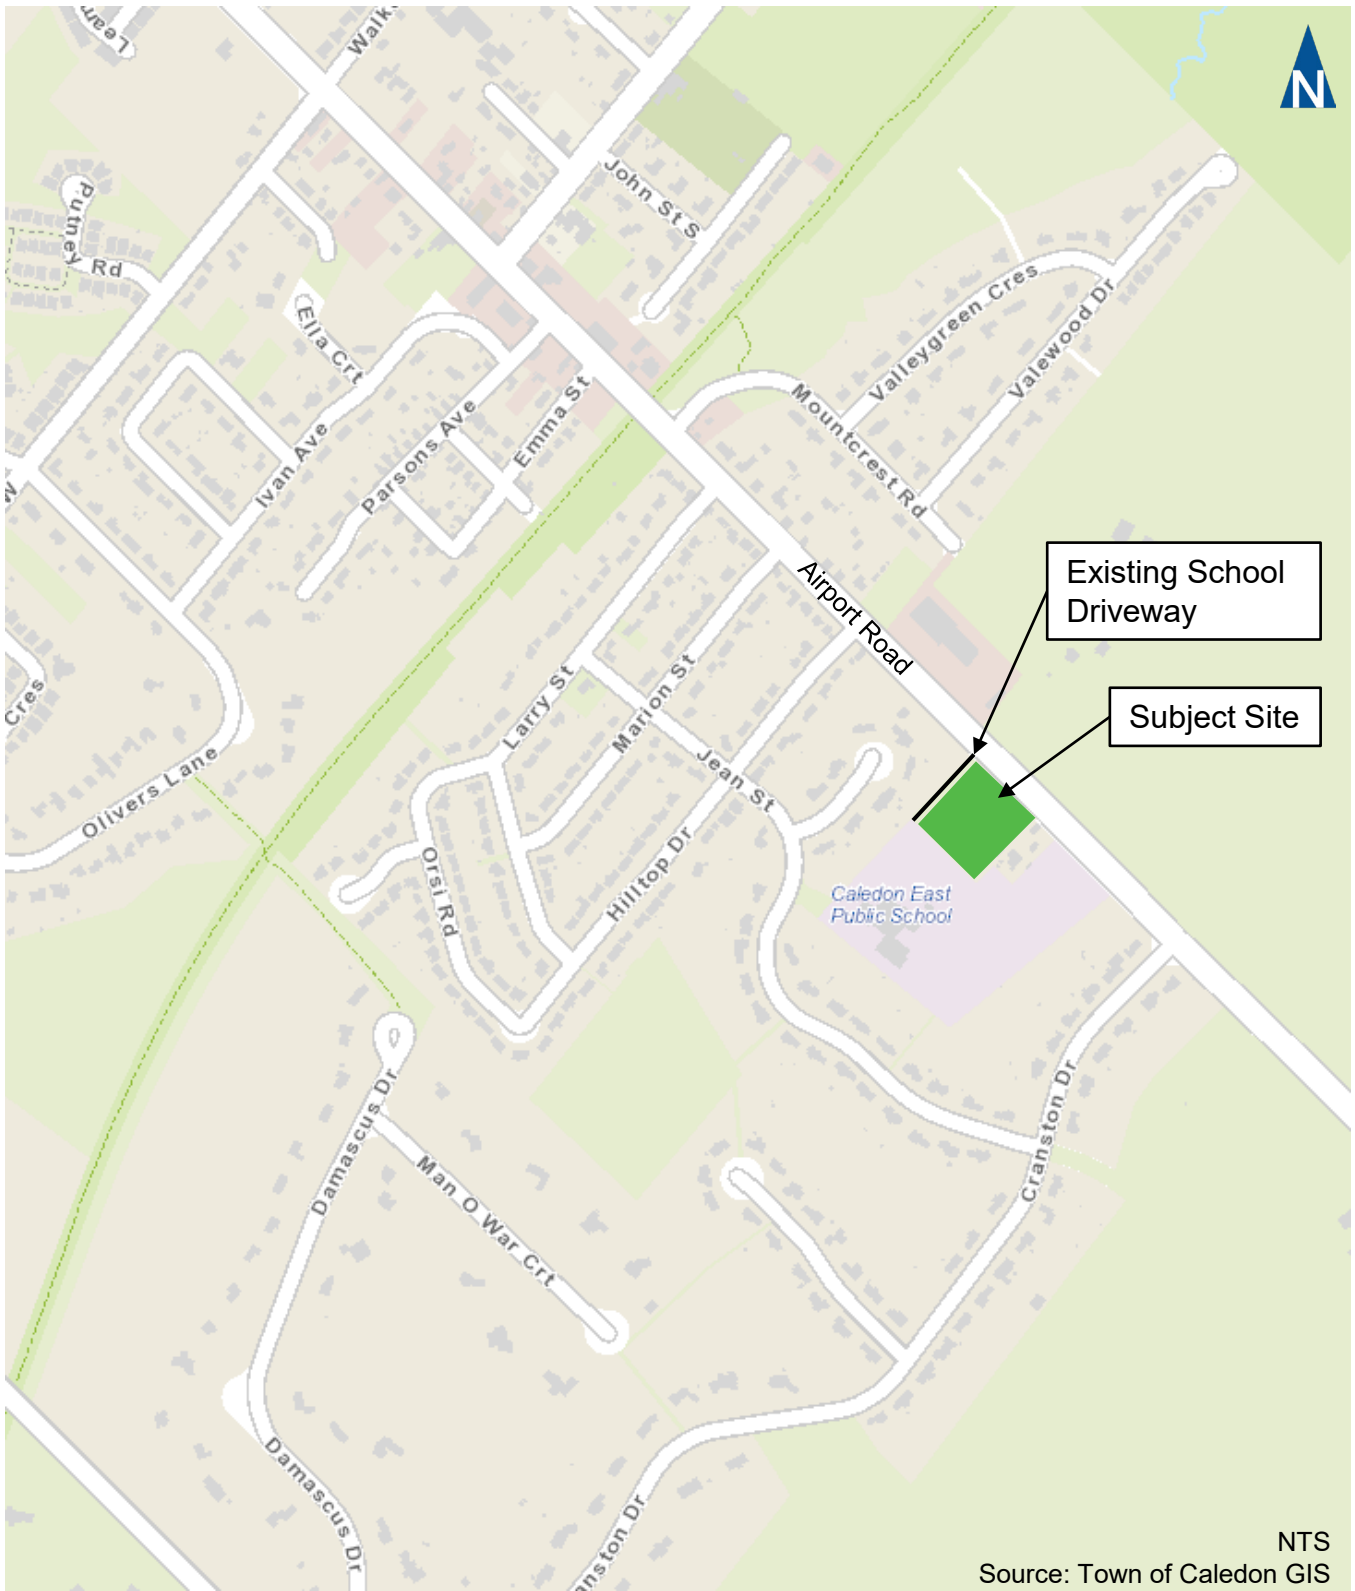

The study area intersections assessed in this study include:

- ▶ Airport Road (Regional Road 7) & Caledon East Public School Driveway (unsignalized);
- ▶ Airport Road & Cranston Drive (unsignalized); and
- ▶ The proposed site driveway to Airport Road.

---

# Study Area and Subject Site Location

## 2 Existing Conditions

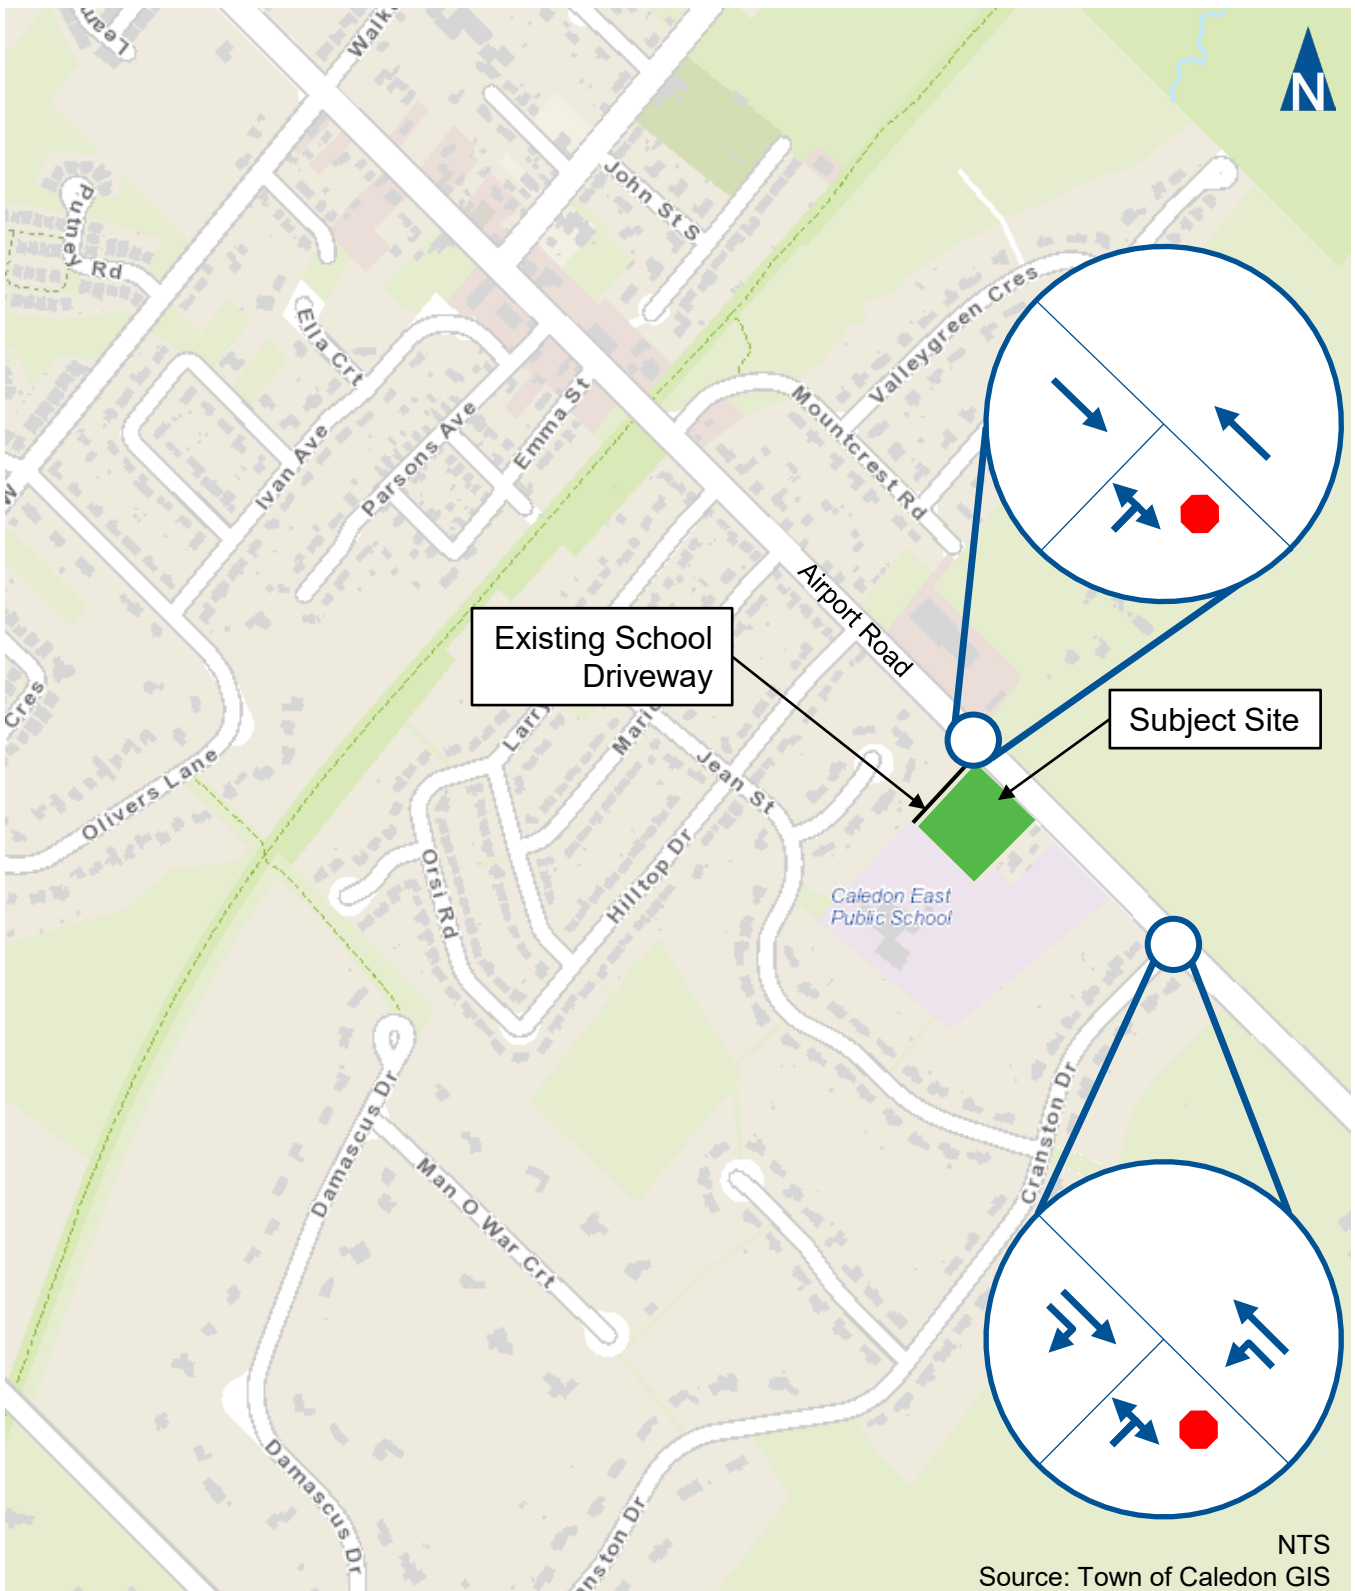

### 2.1 Road Network

The roadways of interest within the study area include:

- ▶ **Airport Road** is a north/south regional roadway under the jurisdiction of the Region of Peel. The road has a two-lane urban/rural cross-section and a posted speed limit of 60 km/h south of the subject site. The posted speed limit transitions to 50 km/h near the south limits of the subject site. Sidewalks are provided on the west side of the roadway to the north of the Caledon East Public School Driveway.
- ▶ **Cranston Drive**, an east/west local road under the jurisdiction of the Town of Caledon. The road has a two-lane urban cross-section, a sidewalk on the north side of the road, and a posted speed limit of 40 km/h within the study area. The approach to Airport Road operates under stop control; and
- ▶ **Caledon East Public School Driveway**, a private driveway serving the Caledon East Public School. The driveway has a two-lane rural cross-section and an assumed speed limit of 50 km/h south of the subject site. The driveway operates as a one-way eastbound connection to Airport Road. Sidewalks are present on the north side of the driveway. No sidewalks are provided along the driveway. The approach to Airport Road operates under stop control.

**Figure 2.1** illustrates the existing lane configuration and traffic control at the study area intersections.

# Existing Traffic Control and Lane Configuration

## 2.2 Cycling Network

Cycling infrastructure typically consists of on-street and off-street facilities. On-street facilities comprise of cycling lanes, signed cycling routes, and paved shoulders. Off-street facilities are in the form of multi-use or informal trails.

No on-street cycling facilities are present within 500 m of the subject site. The Trans Canada Trail<sup>2</sup> is an off-street trail which can be accessed via Airport Road approximately 550 m north of the subject site.

## 2.3 Transit Service

There is currently no transit service available within the Town of Caledon.

## 2.4 Traffic Volumes

**Figure 2.2** illustrates the existing AM and PM weekday peak hour turning movement traffic volumes collected by Paradigm in February 2020. **Appendix B** contains the turning movement data.

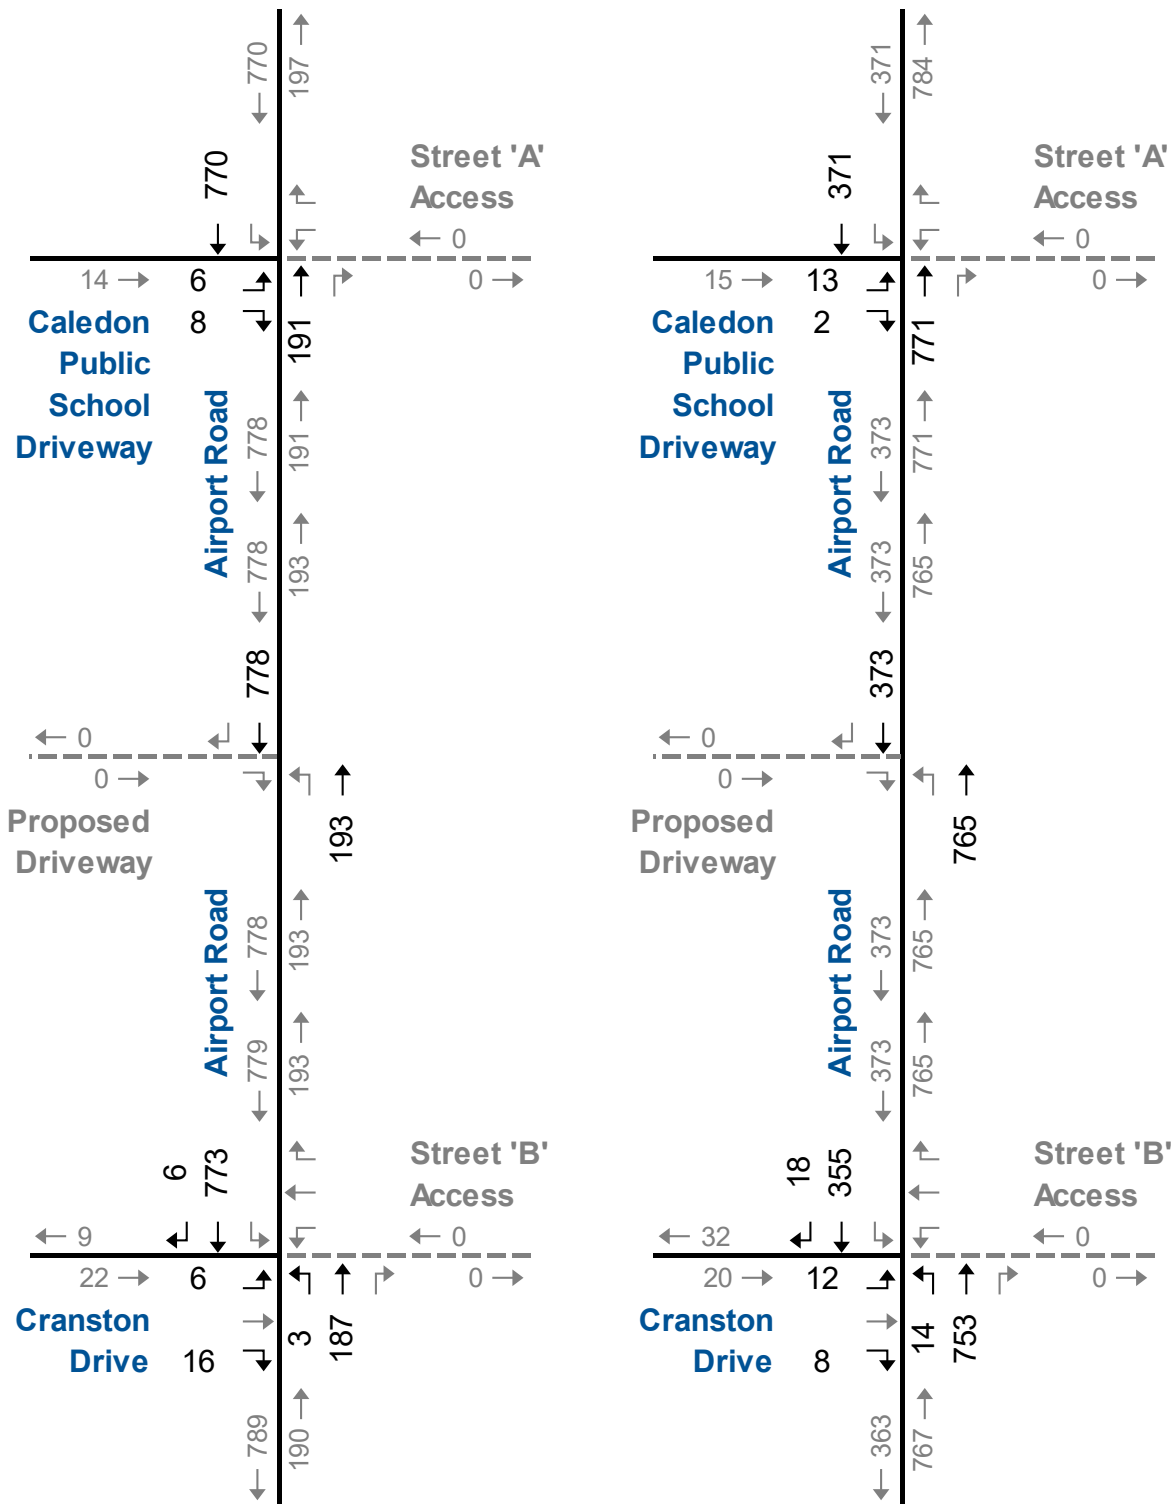

---

<sup>2</sup> <https://maps.caledon.ca/h5/index.html?viewer=Trails.Trails>

### AM Peak Hour

### PM Peak Hour

## Existing Traffic Volumes

Figure 2.2

## 2.5 Traffic Operations

Intersection level of service (LOS) is a recognized method of quantifying the efficiency of traffic flow at intersections. It is based on the delay experienced by individual vehicles executing the various movements. The delay is related to the number of vehicles wanting to make a movement, compared to the estimated capacity for that movement. The capacity is based on several criteria related to the opposing traffic flows. The highest possible rating is LOS A, under which the average total delay is equal or less than 10.0 seconds per vehicle. When the average delay exceeds 80 seconds at signalized intersections (50 seconds at unsignalized), the movement is considered to have a LOS F and remedial measures are usually implemented if they are feasible.

The operations of the intersections in the study area were evaluated using the existing lane configuration, signal timings, and traffic control along with the existing traffic volumes. The intersection analysis considered three separate measures of performance:

- ▶ The LOS for each turning movement;
- ▶ The volume to capacity ratio (v/c) for each movement; and
- ▶ The 95th percentile queue lengths using Synchro 9 and Synchro 10.

Under the Region's TIS Guidelines, the operational analysis must include identification of signalized and unsignalized intersections where:

- ▶ Volume to Capacity ratios (v/c) for overall intersection operations, through movements, or shared through / turning movements increase to 0.90 or above;
- ▶ V/C ratios for exclusive turning movements that will exceed 1.00;
- ▶ Queues for an individual movement are projected to exceed available turning lane storage; and
- ▶ LOS, based on average delay per vehicle on individual movements, exceeds LOS D for unsignalized intersections.

The operations of the intersections in the study area were evaluated with the existing turning movement volumes using Synchro 9. The key parameters used in the analysis as indicated in the include:

- ▶ Existing lane configurations;
- ▶ Heavy vehicle percentages derived from existing traffic counts;
- ▶ Ideal saturation flow rate of 1,900 vehicles per hour per lane (vphpl), as specified in the Region's Synchro Guidelines<sup>3</sup>;
- ▶ Lane widths of 3.7 m and 3.5 m for through and auxiliary turn lanes, respectively, as specified in the Region's guidelines;
- ▶ Posted speed limits;
- ▶ Peak Hour Factor (PHF) of 1.00 for all movements; and
- ▶ Synchro default values for all other inputs.

**Table 2.1** summarizes the level of service conditions at the study area intersections. No critical movements are noted to be occurring at the study area intersections.

**Appendix C** contains the detailed Synchro 9 reports.

---

<sup>3</sup> *Regional Guidelines for Using Synchro*, Region of Peel, December 2010.

## 3 Site Concept

### 3.1 Description

The subject site is located at 15728 Airport Road in the Town of Caledon. The proposed Retirement Home is expected to consist of up to 150 beds in 127 units. Build-out is anticipated to occur by the end of Year 2026.

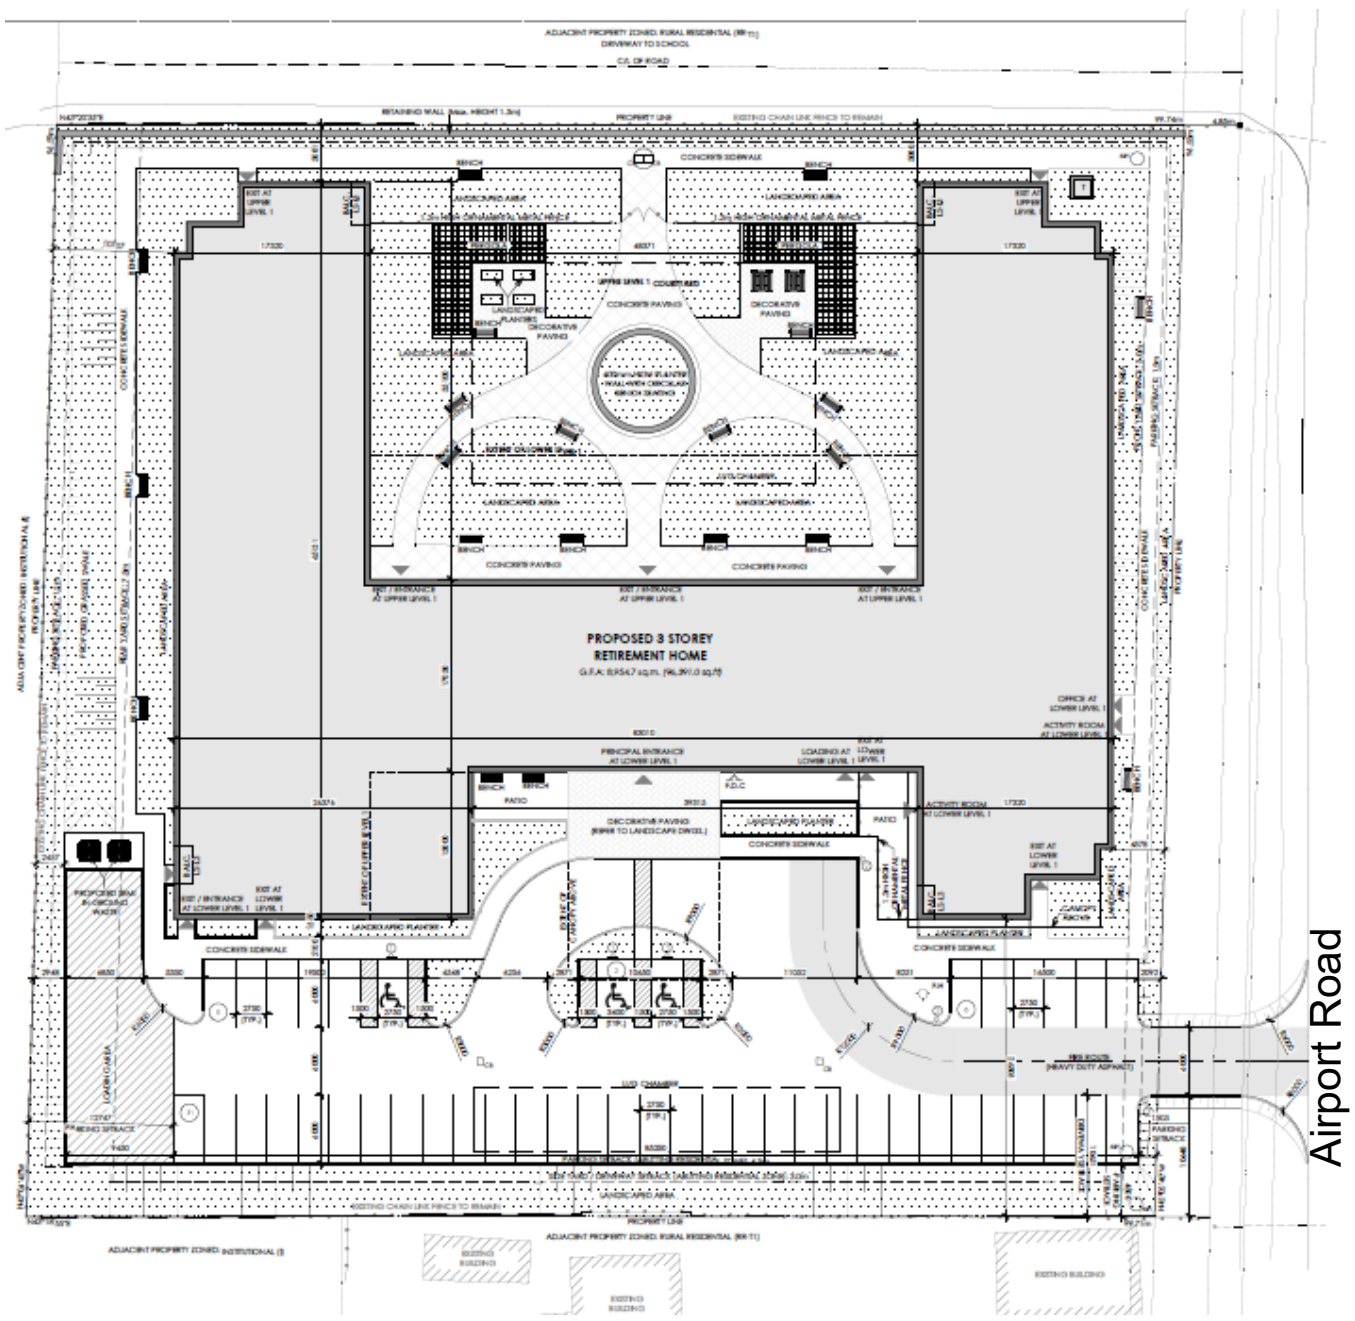

Vehicle access to the site is proposed by a single driveway connection to Airport Road located approximately 80 metres south of the Caledon East Public School Driveway. Left-turns out of the driveway are assumed to be restricted by a raised centre median on Airport Road.

The site provides direct sidewalk connections to Airport Road and the Caledon Public School East Driveway. Sidewalks are provided along the perimeter of the proposed building which also provides access to the internal courtyard area. The sites parking supply consists of 45 spaces of which three are designed as accessible.

The site's loading zone is east of the main entrance and the waste collection area is on the end of the parking lot drive aisle. **Section 3.3** reviews heavy vehicle movements to/from the loading zone.

**Figure 3.1** illustrates the proposed site plan.

# Site Concept Plan

15728 Airport Rd TIS  
200052

Figure 3.1

### 3.2 Trip Generation

The Institute of Transportation Engineers (ITE) Trip Generation<sup>4</sup> methods are used to estimate the site trip generation. Land Use Code (LUC) 254 (Assisted Living) was used to estimate the site trip generation. Average rates were used as the regression equation was unavailable for this LUC.

The subject site is forecast to generate approximately 29 vehicle trips during the AM peak hour and approximately 39 vehicle trips during the PM peak hour. **Table 3.1** summarizes the estimated trip generation. To remain conservative, a mode share reduction was not applied to this development.

**TABLE 3.1: SITE GENERATED TRAFFIC**

Land Use Code	AM Peak Hour				PM Peak Hour			
	Rate	In	Out	Sum	Rate	In	Out	Sum
254: Assisted Living (150 Beds) Average Rates	0.19	18	11	<b>29</b>	0.26	15	24	<b>39</b>
<b>Total New Trips</b>		<b>18</b>	<b>11</b>	<b>29</b>		<b>15</b>	<b>24</b>	<b>39</b>

**Table 3.2** summarizes the estimated trip distribution for site generated traffic. The residential distribution was developed using the Transportation Tomorrow Survey<sup>5</sup> (TTS) data for the zone containing the subject site. **Appendix B** contains the TTS survey data. **Figure 3.2** illustrates site-generated traffic volumes.

**TABLE 3.2: ESTIMATED TRIP DISTRIBUTION**

Origin / Destination	AM Peak Hour		PM Peak Hour

### AM Peak Hour

### PM Peak Hour

## Forecast Site Traffic

### 3.3 Heavy Vehicle Circulation

Heavy vehicle circulation for the loading and waste collection area has been assessed using AutoTURN swept path analysis software. Two design vehicles were used in the analysis:

- ▶ Delivery Truck – Transportation Association of Canada (TAC) Heavy Single Unit (HSU)<sup>6</sup>; and
- ▶ Waste collection – The Peel Region Front Loader<sup>7</sup>.

**Figure 3.3** illustrates the on-site circulation of the TAC HSU and the following is noted:

- ▶ The design vehicle will enter the site via Airport Road and reverse into the loading area. The design vehicle will require the entire driveway width to enter; and
- ▶ To exit the site in a forward movement the design vehicle will require the entire width of the driveway.

**Figure 3.4** illustrates the on-site circulation of the Peel Region Front Loader and the following is noted:

- ▶ The design vehicle will enter the site via Airport Road and front into the waste collection area. The design vehicle will require the entire driveway width to enter the site; and
- ▶ To exit the site, the design vehicle will reverse approximately 55 m into the loading area then exit in a forward movement. The design vehicle will require the entire width of the driveway to exit.

When exiting the site, the design vehicles must encroach into two lanes of traffic to travel southbound. However, the future lane configuration at the time of this study is not confirmed as there is currently an Environmental Assessment (EA) underway for planned improvements to Airport Road.

If the final design for Airport Road includes two southbound lanes at the site access, the design vehicles can wait for a gap in southbound traffic and safely use both lanes when exiting the site. However, if there is one southbound lane and the adjacent lane facilitates opposing traffic, modifications to the proposed driveway curb radii are

<sup>6</sup> 2.4 – *Design Vehicles*, Geometric Design Guide for Canadian Roads, Transportation Association of Canada, June 2017.

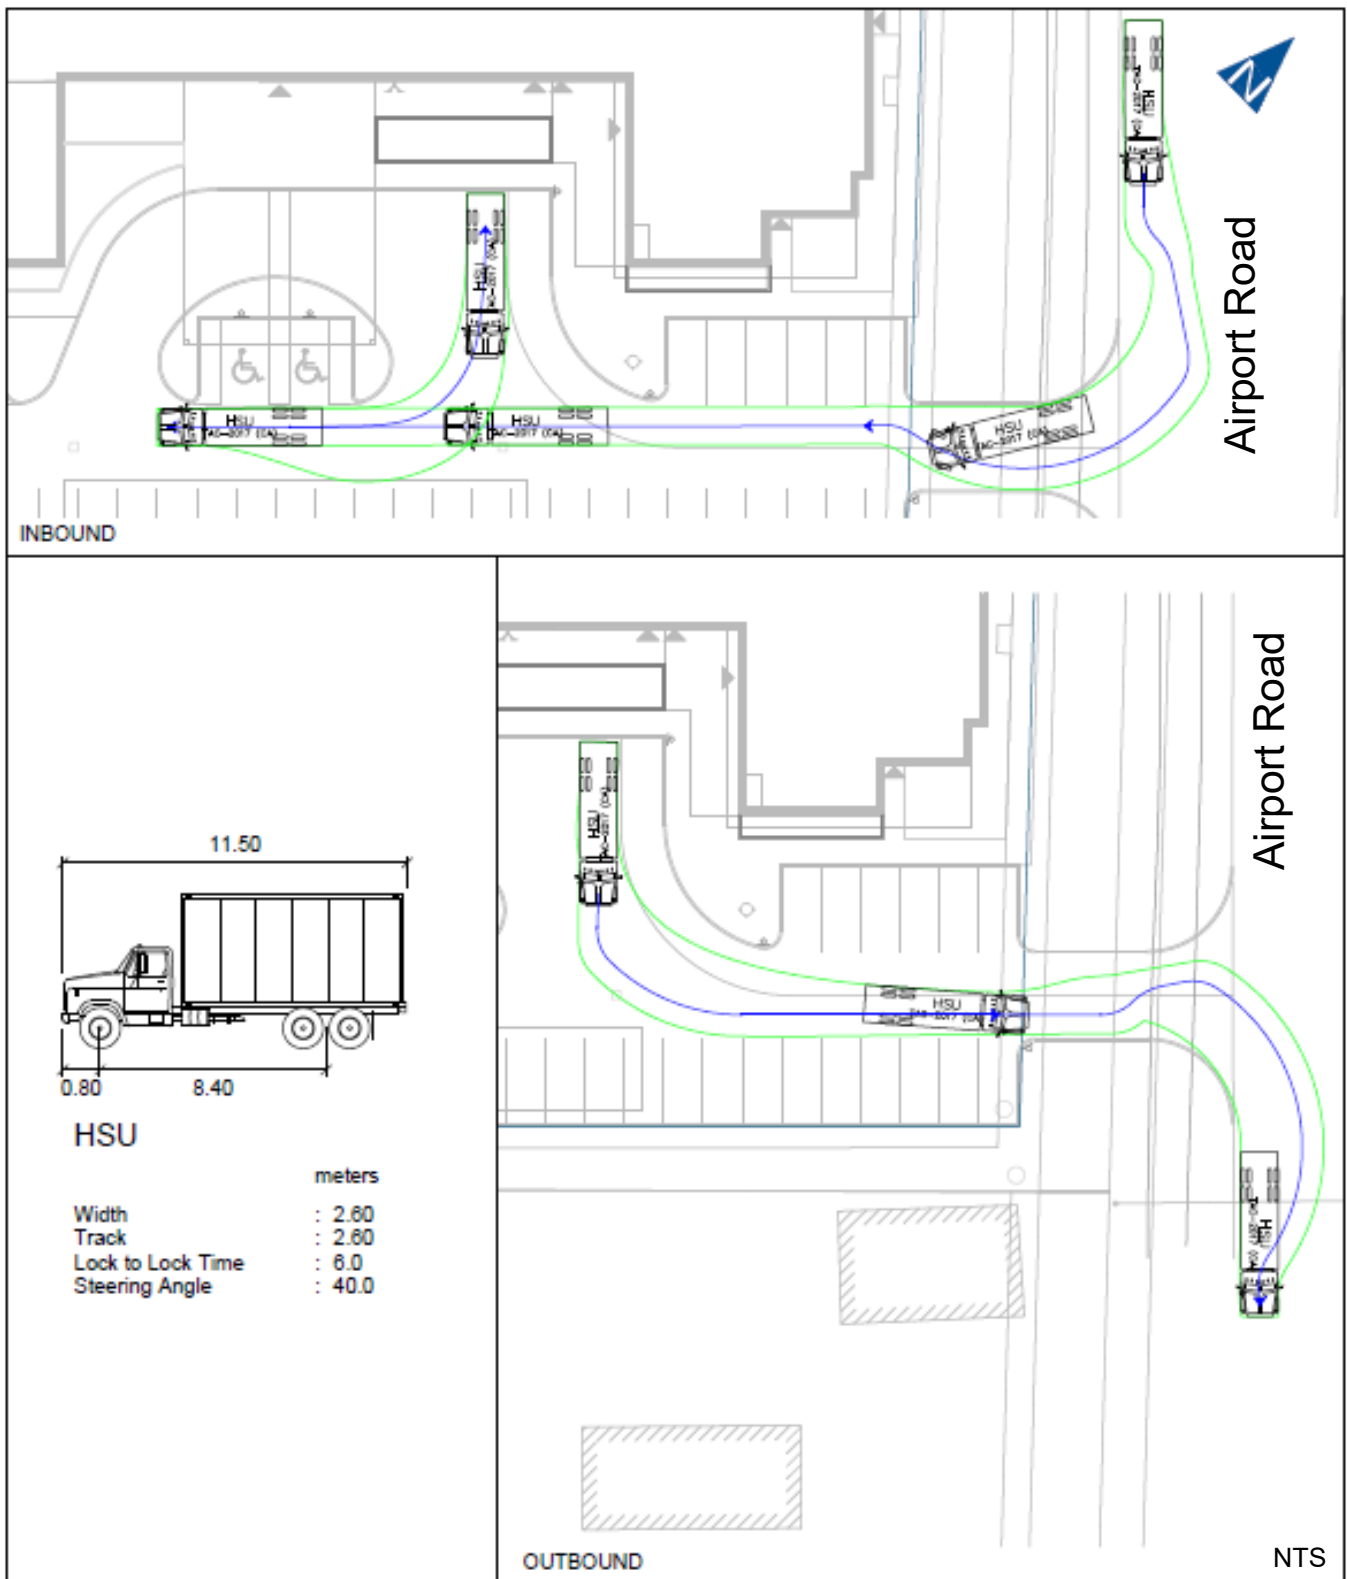

<sup>7</sup> *Appendix 1 – Waste Collection Design Standards Manual*, Region of Peel.

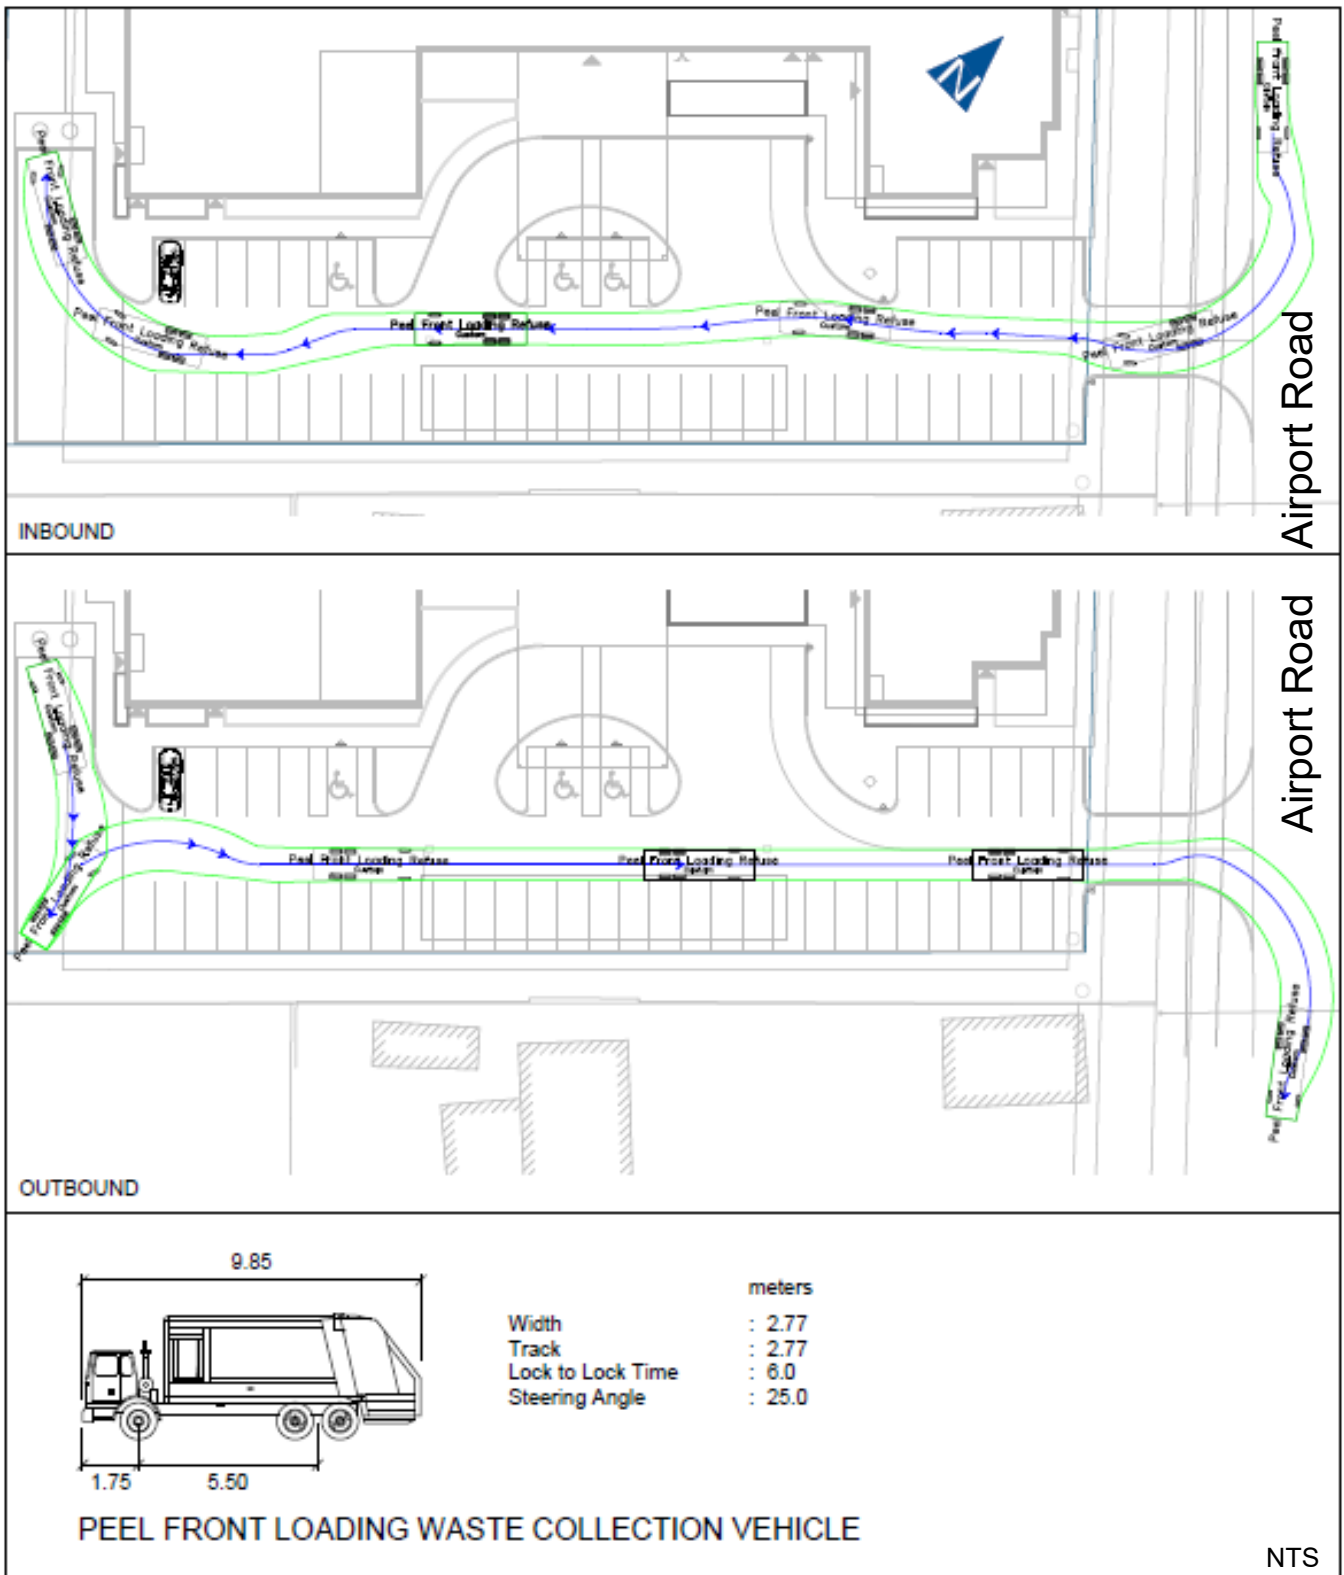

required to permit the design vehicles to enter and exit the site without impacting the opposing travel lane.

The frequency of delivery vehicles and waste collection vehicles is expected to be low with loading and waste collection times managed by the site operator. The level of conflict between the design vehicles and traffic using Airport Road is expected to be low. The reversing maneuvers into the site's loading zone should ideally be assisted by a traffic control person.

## 4 Future Traffic Conditions

The assessment of future conditions in this section includes the following components necessary to assess the site traffic implications on the adjacent road network:

- ▶ Future background traffic estimates;
- ▶ Level of service analysis for background traffic (pre-development);
- ▶ Future total traffic estimates; and
- ▶ Level of service analysis for total traffic (post-development).

### 4.1 Forecast Traffic

As directed by Peel Region staff, a five-year and ten-year horizon from the year of expected build-out (2031 & 2036) has been assessed. The likely future traffic volumes near the subject site are estimated to consist of:

- ▶ Increased non-site traffic (generalized background traffic growth);
- ▶ Traffic generated by the development of 15717 Airport Road<sup>8</sup>. This proposed development includes approximately 641 townhouse units and 30 Senior Adult Housing units. Vehicle access is proposed by two new roadways to Airport Road. Street 'A' is proposed to form the fourth leg to the Caledon Public School Driveway intersection. The Street 'A' intersection is proposed to operate with traffic control signals. Street 'B' is proposed to form the fourth leg to the Cranston Drive intersection. The Street 'B' intersection is proposed to operate with stop control on Cranston Drive and Street 'B'; and
- ▶ Traffic generated by the subject site.

The generalized background traffic growth forecast assumes an annual growth rate of 2.0% per annum and is consistent with the traffic study prepared for the adjacent development applications. **Appendix D** contains the detailed traffic forecast for the adjacent development applications.

<sup>8</sup> 15717 Airport Road, Town of Caledon TIS, Cole Engineering Group LTD, August 2018.

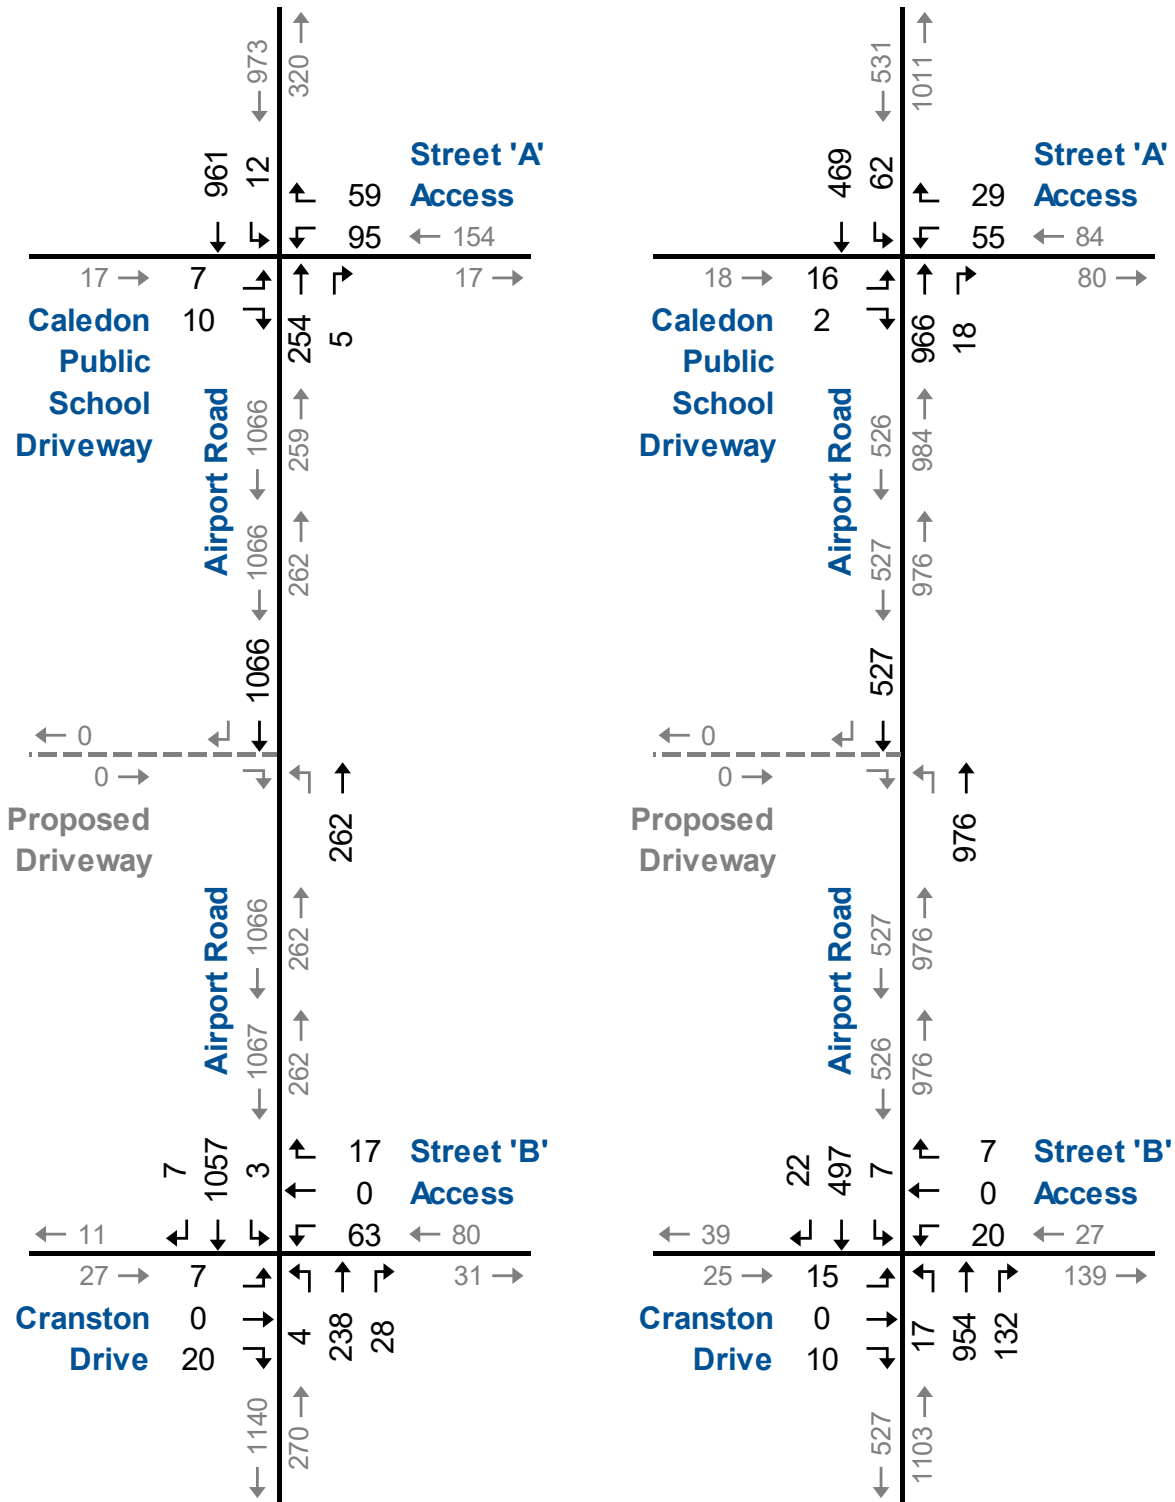

**Figure 4.1** illustrates the forecast 5-year (2031) background forecasts which include the generalized growth and in-stream development. **Figure 4.2** illustrates the forecast 5-Year (2031) total (with development) traffic volumes. **Figure 4.3** illustrates the forecast 10-year (2036) background forecasts which include the generalized growth and in-stream development. **Figure 4.4** illustrates the forecast 10-Year (2036) total (with development) traffic volumes.

## 4.2 Planned Improvements

The Region of Peel is currently undertaking an Environmental Assessment (EA) for planned improvements to the Airport Road corridor from 100 metres north of King Street to 300 metres north of Huntsmill Drive<sup>9</sup>. At time of writing, the EA is not yet finalized.

For analysis purposes, the improvements to Airport Road within the study area were assumed to align with the improvements identified in the 15717 Airport Road TIS<sup>10</sup>. These include:

- ▶ Airport Road at Caledon Public School Driveway / Street 'A';
  - Traffic control signal;
  - The new Street 'A' connection with separate eastbound left-turn and right-turn lanes.
  - Northbound right-turn lane;
  - Southbound left-turn
- ▶ Airport Road at Cranston Drive / Street 'B'
  - The new Street 'B' connection, single lane approach.
  - Northbound right-turn lane;
  - Southbound left-turn.
- ▶ Two-Way Left-Turn Lanes (TWLTL) on Airport Road between the Caledon Public School Driveway and Cranston Drive.

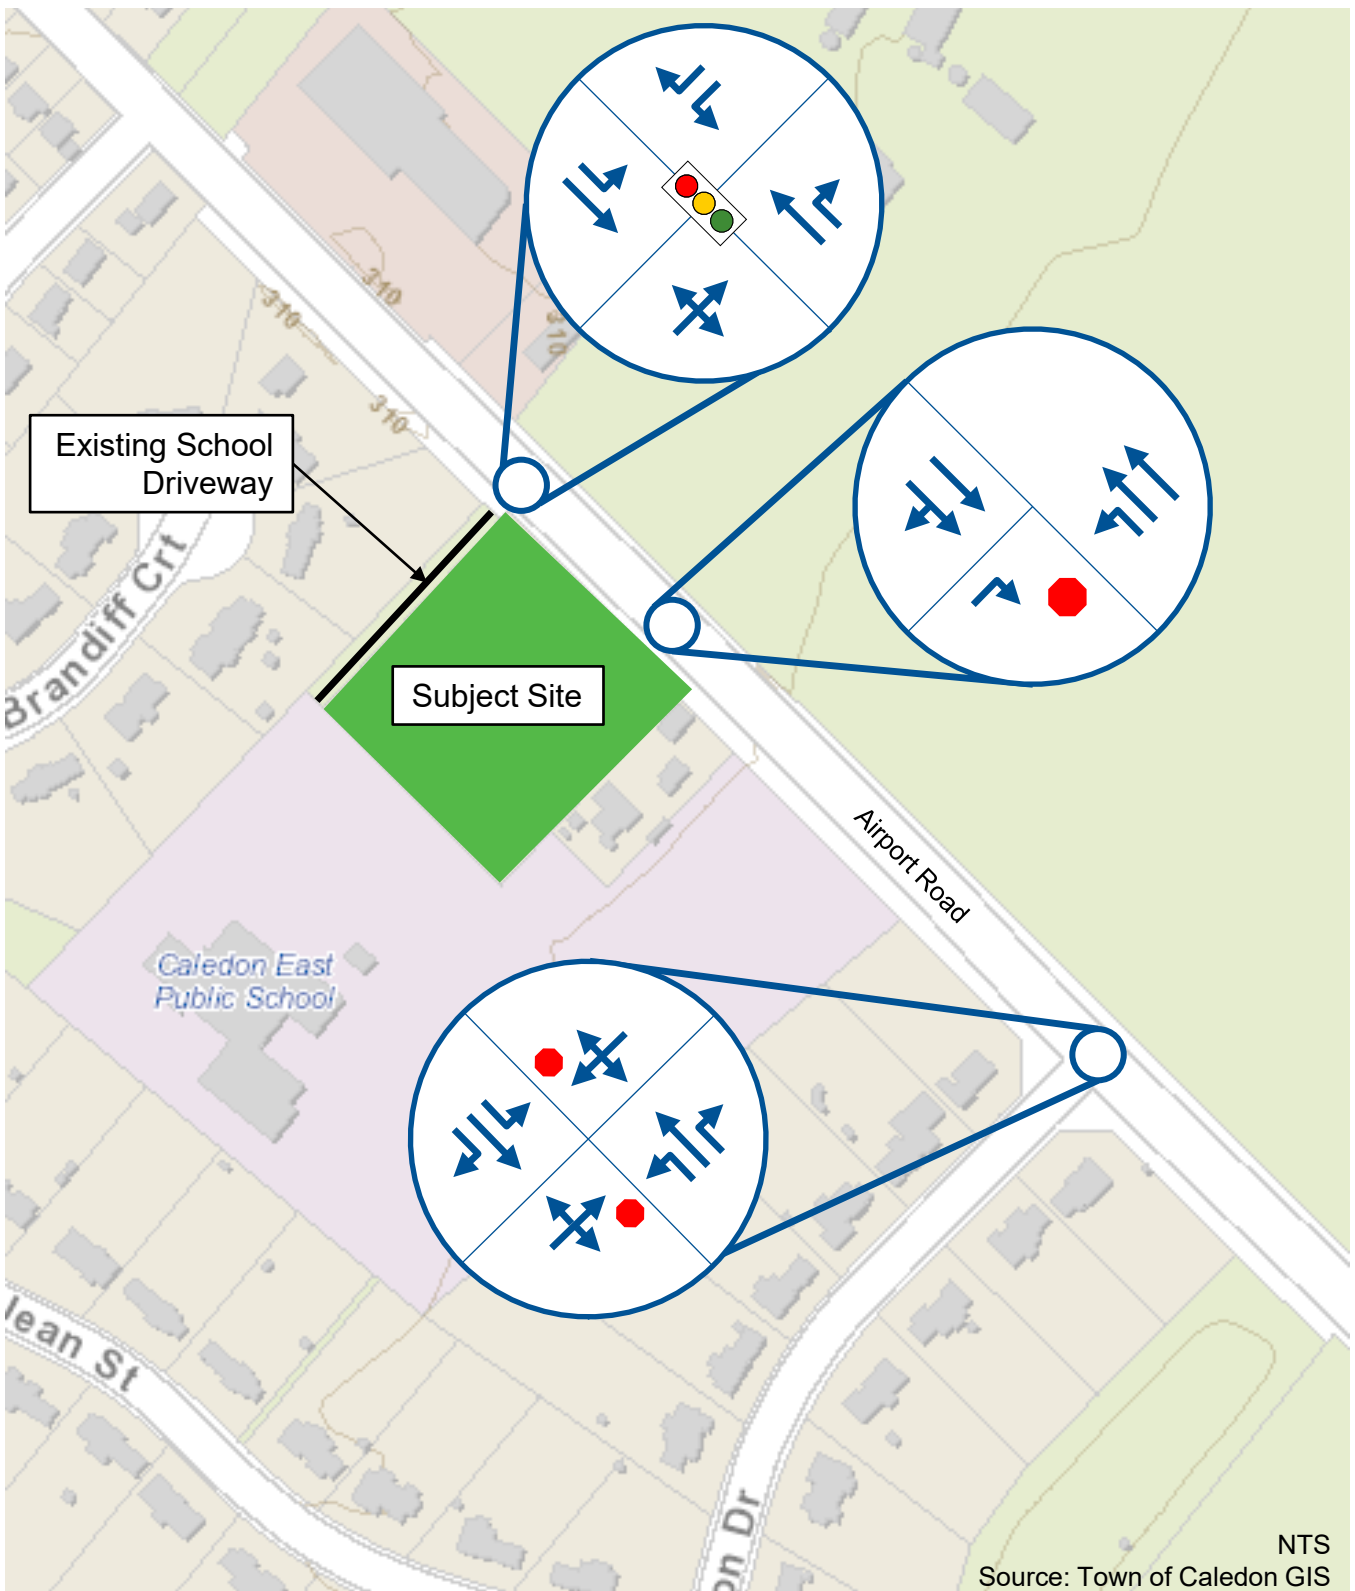

**Figure 4.5** illustrates the future lane configuration.

<sup>9</sup> <https://www.peelregion.ca/pw/transportation/enviro-assess/airport-road-improvements.htm>

<sup>10</sup> Figure 5-1 – Future Lane Configuration, 15717 Airport Road TIS.

## 4.3 Five-Year Horizon

### 4.3.1 Background Traffic Operations

The study area intersection operations analyses followed the same methodology used for existing traffic conditions. The geometric and traffic control improvements outlined in **Section 4.2** are assumed to be in place. Signal timings have been optimized to help ensure reasonable levels of service.

**Table 4.1** summarizes the level of service conditions. No critical movements are noted to be occurring at the study area intersections.

**Appendix E** contains the detailed Synchro 10 reports.

### 4.3.2 Total Traffic Operations

The study area intersection operations analyses followed the same methodology as the background conditions. Signal timings have been optimized to help ensure reasonable levels of service.

**Table 4.2** summarizes the level of service conditions at the study area intersections. The total traffic operations are forecast to operate with similar levels of service as the background operations with no additional critical movements noted.

The site driveway is forecast to operate with delays in the LOS A to B range with v/c ratios of less than 0.05.

The 95<sup>th</sup> percentile queue length on the northbound approach of Airport Road at the Caledon East Public School Driveway intersection is forecast to extend into the operational area of the proposed site driveway during the PM peak hour. The 50<sup>th</sup> percentile queue length is not forecast to reach the site driveway, which suggests the site driveway will be blocked for less than half of the peak hour and will continue to operate with acceptable levels of service.

**Appendix F** contains the detailed Synchro 10 reports.

## 4.4 Ten-Year Horizon

### 4.4.1 Background Traffic Operations

The study area intersection operations analyses followed the same methodology used for five-year background conditions. The geometric and traffic control improvements outlined in **Section 4.2** are assumed to be in place. Signal timings have been optimized to help ensure reasonable levels of service.

**Table 4.3** summarizes the level of service conditions. Study area intersections are generally operating with acceptable levels of service, with the exception of the westbound movement at the Airport Road and Cranston Drive intersection which is forecast to operate at LOS E with a  $v/c < 0.50$  during the AM peak hour.

**Appendix G** contains the detailed Synchro 10 reports.

### 4.4.2 Total Traffic Operations

The study area intersection operations analyses followed the same methodology as the background conditions. Signal timings have been optimized to help ensure reasonable levels of service.

**Table 4.4** summarizes the level of service conditions at the study area intersections. The total traffic operations are forecast to operate with similar levels of service as the background operations with no additional critical movements noted.

The site driveway is forecast to operate with delays in the LOS A to B range with  $v/c$  ratios of less than 0.05.

The 95<sup>th</sup> percentile queue length on the northbound approach of Airport Road at the Caledon East Public School Driveway intersection is forecast to extend into the operational area of the proposed site driveway during the PM peak hour. The 50<sup>th</sup> percentile queue length is not forecast to reach the site driveway, which suggests the site driveway will be blocked for less than half of the peak hour and will continue to operate with acceptable levels of service.

**Appendix H** contains the detailed Synchro 10 reports.

**TABLE 4.3: BACKGROUND TRAFFIC OPERATIONS – 10-YEAR HORIZON**

## 5 Remedial Measures

### 5.1 Signal Warrants

The intersection of Airport Road and Cranston Drive/Street B was assessed using the Ontario Traffic Manual (OTM Book 12 – Justification 7) signal warrant<sup>11</sup> procedures. **Appendix I** contains the warrant analysis. **Table 5.1** summarizes the warrant analysis.

**TABLE 5.1: OTM SIGNAL WARRANT ANALYSIS – SUMMARY**

Intersection	Warrant	Percent Fulfilled	Overall Percentage
Ten-Year Total Traffic Airport Rd and Cranston Dr / Street 'B'	1A	120%	<b>24%</b>
	1B	24%	
	2A	114%	<b>36%</b>
	2B	36%	

Based on the warrant analysis, the criteria necessary to warrant the installation of a traffic control signal is technically not satisfied. No changes to the existing form of traffic control is recommended. It is noted that the Airport Road EA may recommend changes in intersection traffic control that is not discussed in this study.

<sup>11</sup> Ontario Traffic Manual Book 12, Ministry of Transportation of Ontario, July 2001.

## 6 Transportation Demand Management

Transportation Demand Management (TDM) programs consider how choice of travel mode is affected by land use patterns, development design, parking availability, parking cost, and the relative cost, convenience, and availability of alternative modes of travel.

Various TDM strategies are used to influence those factors so that the alternatives to single occupant vehicle travel, such as transit or carpooling, are more accessible.

### 6.1 Proposed TDM Measures

The site provides direct sidewalk connections to Airport Road and the Caledon Public School East Driveway. Sidewalks are provided along the perimeter of the proposed building which also provides access to the internal courtyard area.

### 6.2 Potential TDM Measures

To promote sustainable modes of travel and to further mitigate the site's transportation impacts, the following TDM measures could be considered:

- ▶ **Walking** - Pedestrian amenities including benches, lighting and weather protection be considered for the site's landscaping plan. The on-site pedestrian realm should be designed to provide a safe and attractive environment for employees, residents, and visitors to the site;
- ▶ **Cycling** - Bicycle parking could be provided in convenient and readily accessible locations near the main entrances. End of trip amenities such as secure bike parking and shower/change facilities for employees would enhance the appeal for cycling to work; and
- ▶ **Carpool** - Consider providing preferential carpool parking spaces for employees.

The TDM program should be monitored and adjust as needed by the property manager or an assigned TDM coordinator.

## 7 Conclusions and Recommendations

### 7.1 Conclusions

The main findings and conclusions of this study are as follows:

- ▶ **Existing Traffic:** The study area intersections are operating with acceptable levels of service during the weekday AM and PM peak hours. No critical movements are occurring at the study area intersections.
- ▶ **Planned Improvements:** The Region of Peel is currently undertaking an Environmental Assessment (EA) for Airport Road. At the time of writing, the EA is not yet finalized. For analysis purposes, geometric and traffic control improvements are assumed to be in place for the study area intersections.
- ▶ **Trip Generation:** The site's net trip generation is estimated to be approximately 29 AM peak hour vehicle trips and 39 PM peak hour vehicle trips. Vehicle access to the site is proposed by a driveway connection to Airport Road and left-turns out of the driveway are assumed to be restricted by a raised centre median on Airport Road.
- ▶ **Heavy Vehicle Circulation:** Pending the final lane configuration from the Airport Road EA, modifications to the curb radii and/or entrance width may be required to accommodate the design vehicle to enter and exit the site without impacting the opposing travel lane.

The reversing maneuvers into the site's loading zone should ideally be assisted by a traffic control person.

- ▶ **Background Traffic:** The study area intersections are generally operating with acceptable levels of service, with the exception of the westbound movement at the Airport Road and Cranston Drive intersection which is forecast to operate at LOS E with a  $v/c < 0.50$  during the AM peak hour in the 10-year horizon.
- ▶ **Total Traffic:** The study area intersections are forecast to operate with similar levels of service as the background traffic conditions. No additional critical movements are noted at the study area intersections over background conditions. The site driveway is forecast to operate with delays in the LOS A to B range with  $v/c$  ratios of less than 0.05.
- ▶ **Remedial Measures:** No changes to the existing lane configurations are warranted or required. It is noted that the

Airport Road EA may recommend changes in intersection traffic control that is not discussed in this study.

- ▶ **Transportation Demand Management:** Enhancements to the on-site pedestrian realm, inclusion of bicycle parking and preferential carpool parking will help promote sustainable modes of travel and further mitigate the site's transportation impacts.

## 7.2 Recommendations

Based on the findings of this study, it is recommended that:

- ▶ The Region of Peel monitor the outcome of the Airport Road EA to determine if modifications to the curb radii and/or entrance width are required to the proposed driveway; and
- ▶ The site operator manages deliveries and waste collection to minimize on-site disruptions. Reversing maneuvers into the site's loading zone should ideally be assisted by a traffic control person.

# Appendix A

## Pre-Study Consultation

## Stefan Hajgato

---

**From:** Kol, Rani <rani.kol@peelregion.ca>  
**Sent:** February 14, 2020 10:03 AM  
**To:** Stefan Hajgato  
**Cc:** Carrick, Sean; Hamdani, Hashim; Casey Blakely; Scott Catton  
**Subject:** Traffic Engineering Comments - Terms of Reference - Wyndham Retirement Home - 15728 Airport Road - our file D-00728880W  
**Attachments:** FW: Seniors site - 15728 Airport Road

Hi Stefan,

The Traffic Engineering section has reviewed the proposed Terms of Reference for 15728 Airport Road and wishes to provide the following responses in red;

=====

We've been retained to complete a Transportation Impact Study (TIS) for a proposed Retirement Residence located at 15728 Airport Road in Caledon. The preliminary development plan (attached) includes 144 beds in 140 units with an expected trip generation of approximately 27 AM and 37 PM peak hour vehicle trips. We are proposing the following scope:

- **Study Area:**
  - Airport Road (RR7) & Cranston Drive;
  - Airport Road (RR7) & Caledon East Public School Driveway; and
  - One all-moves access onto Airport Road (RR7). **Previous discussions took place regarding the type of access that would be permitted and considered to the lands. See attached correspondence which outlines the details. It has been noted in the past that the Region would support a right in/right out access to the site. Consideration for a left-in movement can be made, subject to the surrounding existing and proposed developments being incorporated into the analysis.**
  - **Proposed residential development at 15717 Airport Road: Please work with the Developer with regards to incorporating the access design of the northerly restricted access to their site into your proposed study analysis.**
- **Horizon Years:**
  - Existing (Year 2020); and
  - Five years from Build-Out (date TBD).
  - **Ten years from Build-Out**
- **Analysis Periods:** Weekday AM & PM peak hours.
- **Trip Generation:** ITE LUC 254 (Assisted Living)
- **Background Growth:**
  - General Background Growth Rate: 2.0% compounded per annum. The TIS for the neighboring development located at 15717 Airport Road (attached) indicated a 2% growth rate was used to forecast 2021-2031 background conditions in the Airport Road EA; and **we support this growth rate.**
  - Other Approved and Pending Developments: 15717 Airport Road site generated trips.
- **Trip Distribution:** 2016 TTS Survey, which is consistent with the 15717 Airport Road TIS.

**Could you please provide:** The Airport Road EA for use in determining planned geometric improvements and confirming the background growth rate. **Please contact Sonya Bubas (ext. 7801, [sonya.bubas@peelregion.ca](mailto:sonya.bubas@peelregion.ca)), the Project Manager for the Airport Road EA (#16-4360) to obtain the most up to date material.**

=====

Also, for your use please see the below standard Terms of Reference outline;

## Full Description

The study must provide a full description of the proposed development. This includes, but is not limited to:

- 1. Municipal address.
- 2. Existing land uses that are permitted and use provisions in an Official Plan Amendment, Zoning By-law, etc.
- 3. Proposed land uses.
- 4. Floor space, including a summary of each type of use and/or number of residential units (where applicable).
- 5. Anticipated date of occupancy.
- 6. Approximate hour of operation.
- 7. Planned phasing of the development.
- 8. Nearby Regional intersections and access to adjacent developments, including type of control (signalized or unsignalized).
- 9. Number of lanes, width and configuration:
  - The requirements for auxiliary turn lanes shall be reviewed. Adequate spacing must be provided between access points in accordance with the Region of Peel's current [Controlled Access By-law](#), as amended. All design standards must be in accordance with those outlined in the Transportation Association of Canada (TAC) Geometric Design Guide for Canadian Roads and the Ministry of Transportation, Ontario (MTO) Geometric Design Standards for Ontario Highways.
- 10. Proposed access points and type of access:
  - When determining the location of an access, consideration should be given to how the access will affect the surrounding road network, area residents and area businesses. All proposed site access points on Regional roads should be evaluated for capacity, safety and adequacy of queue storage capacity. Approval of the proposed access will be evaluated using the Region of Peel's current [Controlled Access By-law](#), as amended and sound engineering judgement.
- 11. Nearby transit facilities/stops.
- 12. Bike paths.
- 13. A combination of maps and other documentation, which will identify all relevant information.

## Traffic Volume Analysis

A traffic volume analysis must include:

- 1. Horizon years of 5 and 10 and 20 depending on full build-out, or as advised by Regional staff.
- 2. AM and PM peak periods at a minimum. Commercial development requires Saturday analysis - note that the analysis of turning movement counts (TMCs) for a Saturday of a holiday weekend will not be accepted except when directed by Regional staff.
- 3. Background, site-generated and total traffic volumes.
- 4. "Worst case" combination of site-related and background traffic.
  - Please contact Roman Kuczynski, Supervisor, Transportation Planning at extension 4381 to obtain the Growth Rates along Airport Road;
  - Please contact Damian Jamroz, Supervisor, Traffic Operations at extension 7856 for most recent average annual daily traffic (AADT) and TMCs required for the study; and
  - Please contact Rick Laing, Supervisor, Traffic Signals and Streetlighting at extension 7859 for the most up-to-date Traffic Signal Timing Parameters and ensure that the information includes the appropriate walk/don't walk splits, recall modes and offsets.
  - Please contact [Development Services Planning](#) staff to obtain details on surrounding developments in the area that would affect traffic capacity in the planning horizon year(s).

## Trip Generation and Distribution

A trip distribution and trip generation analysis must include:

- 1. Trip generation surveys from similar developments in the Region which have similar operating characteristics as the proposed development.

- 2. Latest edition of the Institute of Transportation Engineers (ITE) trip generation rates are acceptable (use the greater of the average rate method or the fitted line equation).
- 3. A table summarizing your findings.
- 4. Trip distribution assumptions must be supported by one or more of the following:
  - Transportation Tomorrow Survey
  - Origin-destination surveys
  - Comprehensive travel surveys
  - Existing/anticipated travel patterns
  - Output from the Region of Peel [Travel Demand Forecasting Model](#)
  - Market studies

## Capacity Analysis

The report must include capacity analysis completed in Synchro (version 7.0 preferred, but version 8.0 will be accepted as per the Highway Capacity Manual (HCM) 2000 standards and not the new HCM 2010 module). Unsignalized analysis can be completed in either Synchro or CCG Intercalc (2008 version at a minimum).

The following parameters must be used in either software:

- Saturation flow rate of 1,900 vehicles per hour
- 3.7 metre lane width on Regional roads; and
- 3.5 metre lane width on the intersecting street(s) and/or access(es)

For Synchro analysis, see [Regional Guidelines for Using Synchro 7.0](#) for other individual parameters. For CCG Intercalc analysis, saturation adjustments should include a complete breakdown of vehicle types by percentage (based on available data) and is to be documented in a table in the report.

The analysis must also include the identification of signalized intersections, unsignalized intersections and unsignalized accesses where:

- 1. Volume/capacity (V/C) ratios for overall intersection operations, through movements or shared through/turning movements increased to 0.90 or above.
- 2. V/C ratios for exclusive movements that will exceed 1.00.
- 3. 95th percentile queue lengths for individual movements and do they exceed available lane storage.

All intersections that are modelled as signalized intersections (other than existing signalized intersections) must be supported by an [Ontario Traffic Manual \(OTM\) Book 12](#) traffic control signals warrant, each one required to be included in the appendix of the TIS.

If traffic control signals are found to be warranted at a particular intersection in an earlier horizon year (e.g. 5 year horizon), a warrant is not required for the subsequent horizon year (e.g. 10 year horizon). The horizon year in which a particular intersection is warranted for traffic control signals must be documented in the text of the TIS. A roundabout feasibility analysis may also be required at the direction of Regional staff.

In Synchro unsignalized intersection analysis, if an unacceptable LOS ("E" or higher) and v/c ratio results on the minor approach in existing conditions analysis, the consultant shall conduct a gap study to establish an average value for gaps accepted (in seconds) and override the resultant value for the HCM-calculated critical gap in the Signing window.

For horizon year analysis with an existing two-lane road, if the road is forecasted to be widened to four lanes by the respective horizon year, the consultant shall override the resultant value for the HCM-calculated critical gap in the Signing window by inputting recommended values for critical gap of left-turning and right-turning movements onto a four-lane road as identified in the Ministry of Transportation, Ontario (MTO) Geometric Design Standards for Ontario Highways.

## Sight Distance Evaluation

A review and analysis of the sight distance availability for all proposed accesses or roads is required. The sight distance requirements must be determined based on the most current standards and guidelines used by the Region of Peel. Available sight distance should be taken from actual field measurements to ensure accurate conditions.

Assess the sightlines based on the Region of Peel's standard practice, eye height and object height of 1.05 metres and 0.38 metres above road surface, respectively. The Region requires the access to meet the following sightline requirements:

1. Stopping sight distance; and
2. Turning sight distance.

Sight distances must be in accordance with the Transportation Association of Canada (TAC) Geometric Design Guide for Canadian Roads methodology. Folded full size and to scale drawings of the sightline analysis are required for our review and comment.

## **Safety**

Identification of potential safety or operational issues must be reviewed that are associated with:

- weaving
- merging
- corner clearances
- sight distances
- vehicle/pedestrian conflicts
- traffic infiltration
- access conflicts
- cyclist movements
- heavy truck movement conflicts

In addition, should the development be determined by Regional staff to be adjacent to a Regional intersection or road segment with significant collision history, most recent five-year collision data for the intersection(s) and/or road segment (s) must be reviewed and an assessment of the impact of the proposed development provided. Such information may be helpful to minimize any additional problems through the design or location of access points along the subject Regional road(s). Please contact William Toy, Supervisor, Traffic Safety at extension 7869 for collision information.

## **Functional Design**

A functional design detailing a recommended access configuration and/or proposed intersection geometrics may be required at the discretion of Regional staff.

## **Final Report**

The following study structure is suggested:

- 1. Site/development description
- 2. Study area, including map
- 3. Existing conditions - exhibit required
- 4. Analysis periods
- 5. Background, existing, future background and future total traffic demand - exhibit required
- 6. Site generated traffic - exhibit required
- 7. Improvement alternatives
- 8. Traffic impacts for future background and total traffic with and without mitigation (tabular summaries)
- 9. Access considerations
- 10. Recommendations

The TIS should consist of a main document, supplemented by technical appendices containing detailed analyses as required.

The Region of Peel will require 1 copy to be in electronic format and 1 hard copy complete with the appropriate supporting documentation. This shall be submitted to the Traffic Engineering section of Public Works for our review, comment and approval.

All information submitted to Regional staff in connection with any Traffic Impact Study will be considered to be in the public domain.

## Appendix

The appendix must include:

- 1. Turning movement counts (include date counted) with breakdown of heavy vehicle counts;
- 2. Signal timing plan(s) for signalized intersections; and
- 3. For submissions using Synchro, generated Synchro reports showing HCM 2000 results and queuing, as well as electronic Synchro files (CD copy or sent concurrently with the TIS via email); or
- 4. For submissions using CCG Intercalc, a CCG Intercalc summary report.

## Study Updates

From the date of submission, the Traffic Impact Study will have a "shelf life" of 5 years. Where timing of subsequent development approvals exceeds 5 years, a new study will be required at the discretion of the Region of Peel.

Hi Stefan,

I just got back to the office from vacation and am catching up on emails. I've just passed this onto Hashim's team to review and provide comments on the TOR. For our records, has a planning application been made to the Town?

Thanks,

Sean

**Subject:** (200052: Wyndham Retirement Home) Terms of Reference

Good morning Sean, Mary, and Casey,

We've been retained to complete a Transportation Impact Study (TIS) for a proposed Retirement Residence located at 15728 Airport Road in Caledon. The preliminary development plan (attached) includes 144 beds in 140 units with an expected trip generation of approximately 27 AM and 37 PM peak hour vehicle trips. We are proposing the following scope:

- **Study Area:**
  - Airport Road (RR7) & Cranston Drive;
  - Airport Road (RR7) & Caledon East Public School Driveway; and
  - One all-moves access onto Airport Road (RR7).
- **Horizon Years:**
  - Existing (Year 2020); and
  - Five years from Build-Out (date TBD).
- **Analysis Periods:** Weekday AM & PM peak hours.
- **Trip Generation:** ITE LUC 254 (Assisted Living)
- **Background Growth:**
  - General Background Growth Rate: 2.0% compounded per annum. The TIS for the neighboring development located at 15717 Airport Road (attached) indicated a 2% growth rate was used to forecast 2021-2031 background conditions in the Airport Road EA; and
  - Other Approved and Pending Developments: 15717 Airport Road site generated trips.
- **Trip Distribution:** 2016 TTS Survey, which is consistent with the 15717 Airport Road TIS.

**Could you please provide:** The Airport Road EA for use in determining planned geometric improvements and confirming the background growth rate.

Please let me know if you have any questions or comments.

Best regards,

**Stefan Hajgato, E.I.T.**

## Signal Warrant

**(OTM Book 12 - Justification 7)**

Horizon Year: 2036 Total  
 Region/City/Township: Caledon East

Major Street: Airport Road North/South?: Y  
 Minor Street: Cranston Dr/Street 'B' Access

Number of Approach Lanes: 1  
 Tee Intersection?: N  
 Flow Conditions: Restricted  
 PM Forecast Only? N

Warrant Results			
150% Satisfied	No	Justification for new intersections with forecast traffic	
120% Satisfied	No	Justification for existing intersections with forecast traffic	

Time Period	Major Street Airport Road						Minor Street Cranston Dr/Street 'B' Access						Peds Crossing Main Road
	Northbound			Southbound			Eastbound			Westbound			
	Left	Through	Right	Left	Through	Right	Left	Through	Right	Left	Through	Right	
AM Peak Hour	4.1183571	269.71093	28	3	1166.1634	10.236714	9.2367142	0	21.964571	63	0	17	0
PM Peak Hour	19.219	1062.7076	132	7	557.33893	34.710143	16.473428	0	10.982286	20	0	7	0
Average Hourly Volume	6	333	40	3	431	11	6	0	8	21	0	6	0

Warrant	AHV
1A - All	865
1B - Minor	41
2A - Major	824
2B - Cross	27

**Warrant 1 - Minimum Vehicular Volume**

1A	Approach Lanes	1		2 or more		Average Hourly Volume
	Flow Conditions	Free	Restricted	Free	Restricted	
	All Approaches	480	720	600	900	
					% Fulfilled	120.1%

1B	Approach Lanes	1		2 or more		Average Hourly Volume
	Flow Conditions	Free	Restricted	Free	Restricted	
	Minor Street Approaches	120	170	120	170	
					% Fulfilled	24.4%

**Warrant 2 - Delay To Cross Traffic**

2A	Approach Lanes	1		2 or more		Average Hourly Volume
	Flow Conditions	Free	Restricted	Free	Restricted	
	Major Street Approaches	480	720	600	900	
					% Fulfilled	114.4%

2B	Approach Lanes	1		2 or more		Average Hourly Volume
	Flow Conditions	Free	Restricted	Free	Restricted	
	Traffic Crossing Major Street	50	75	50	75	
					% Fulfilled	36.2%
