1.0 Introduction

C.F. Crozier & Associates Inc. (Crozier) was retained by 12599 Hwy 50 Ltd. (the Owner) to prepare a Functional Servicing and Stormwater Management Report in support of an Official Plan Amendment (OPA) and Zoning By-Law Amendment (ZBA) related to the mixed-use development for the subject lands located at 12563 & 12599 Highway 50 and 2 Industrial Road (the Site) in the Town of Caledon, Region of Peel.

This report outlines the proposed functional servicing and stormwater management plan for the Site, in accordance with the requirements of the Province of Ontario (Province), Region of Peel (Region), Town of Caledon (Town), and Toronto Region Conservation Authority (TRCA). The following reports, design criteria, and as-constructed drawings were referenced during the preparation of this report:

Provincial Guidelines:

• Stormwater Management Planning and Design Manual (Ministry of Environment, Conservation and Parks, March 2003)

Regional Guidelines:

- Water and Wastewater Master Plan for the Lake-based Systems (Region of Peel, June 2020)
- Public Works Design, Specifications, and Procedures Manual, Linear Infrastructure, Watermain Design Criteria (Region of Peel, revised June 2010)
- Public Works Design, Specifications, and Procedures Manual, Linear Infrastructure, Sanitary Sewer Design Criteria (Region of Peel, modified March 2017)

Municipal Guidelines:

• Development Standards Manual Version 5.0 (Town of Caledon, 2019)

Conservation Authority Guidelines:

• Stormwater Management Criteria (Toronto Region Conservation Authority, August 2012)

<u>As-Constructed Drawings:</u>

- Plan 03631-D, Highway 50, Proposed 250 Sanitary Sewer and 150 Forcemain, prepared by Region of Peel, dated May 1984.
- Plan 03632-D, Highway 50, Proposed 250 Sanitary Sewer and 150 Forcemain, prepared by Region of Peel, dated May 1984.
- Plan 03636-D, Industrial Road, 300 Watermain, prepared by Region of Peel, dated April 23, 1980.
- Plan 8187-D, Industrial Road, Sanitary Sewer, prepared by Beech Engineering Limited, dated September 1989.

- Drawing 03-110-01, Site Plan, Highway No. 50 Storm Sewer Connection, prepared by Calder Engineering Ltd., dated January 12, 2007.
- Drawing 63552-A-1, Site Plan, prepared by Aquafor Beech Limited, dated March 26, 2002.

Relevant as-constructed drawings are provided in Appendix A for reference.

2.0 Site Description

The Site covers an area of approximately 3.52 ha and currently consists of commercial and industrial land uses. The Site is located in the Bolton Highway 50 Commercial Area within the Bolton Urban Boundary and is bound by Highway 50 to the south-west, existing commercial developments to the south, Industrial Road to the south-east, and existing commercial developments to the north-west, north, and north-east. Zoning By-law 2006-50, Schedule A, Zone Map 1a (Town of Caledon, April 2018) states that the current land classification of the Site is "Bolton Highway Commercial" (CHB).

The proposed development for the Site, as per the Site Plan (SRN Architects, February 26, 2021) and Project Statistics (SRN Architects, January 5, 2022), provided in Appendix A, includes five (5) mixed-use, mid-rise and high-rise towers, detailed as follows:

- Building 1: 29-storey mixed-use commercial and condominium residential building.
- Building 2: 29-storey mixed-use commercial and condominium residential building.
- Building 3: 27-storey mixed-use commercial and condominium residential building.
- Building 4: 25-storey mixed-use, commercial and condominium residential building.
- Building 5: 23-storey mixed-use commercial and condominium residential building.

In addition to the towers, the development will include at-grade parking and three levels of underground parking, landscaped areas, and access to Highway 50 and Industrial Road.

3.0 Water Servicing

The Region of Peel is responsible for the operation and maintenance of the public water distribution and treatment system in the Town of Caledon, and any local system will have to connect to this public system. The existing and proposed water servicing is discussed in the following sections.

3.1 Existing Water Servicing

The Site is located in Pressure Zone 6, where existing water infrastructure generally provides adequate water supply and pressures up to a serviceable elevation of 259.1 meters above sea level (masl). Water is sourced from the Bolton Elevated Tank, which stores water from the Tullamore Reservoir Pumping Station. A review of as-constructed drawings from the Town and the Region shows the following watermains near the Site:

- Existing 300 mm diameter watermain on the north side of Industrial Road.
- Existing 300 mm diameter watermain on the west side of Highway 50.

Multiple hydrants are located near the Site for fire protection:

- Existing hydrant on the southwest corner of Highway 50 and Hopcroft Road near 12566 Highway 50 approximately 30 m from the Site.
- Existing hydrant on the northeast corner of Highway 50 and Industrial Road.
- Existing hydrant on the north side of Industrial Road approximately 130 m east of the intersection of Highway 50 and Industrial Road.

3.2 Design Water Demand

The Water and Wastewater Master Plan (Region of Peel, 2020) was used to determine the maximum domestic water demand generated by the Site, based on an equivalent population estimate for the Site. An equivalent population estimate was determined using the Project Statistics (SRN Architects, January 5, 2022), email correspondence with Alexander Sepe (December 1, 2020) confirming population density information, and the Linear Infrastructure Sanitary Sewer Design Criteria (Region of Peel, March 2017). Table 1 below provides a summary of the population estimate for the Site. Site statistics are provided in Appendix A, and supporting calculations are provided in Appendix B.

Building Number	Townhouse	Apartment 1, 1+	Apartment 2, 2+	Apartment 3	Total Unit Population	Amenity Equivalent Population
Building 1	0	339	589	68	996	
Building 2	18	358	462	57	894	
Building 3	28	289	533	84	934	63
Building 4	49	486	810	27	1372	
Building 5	0	235	356	68	658	
Total	95	1707	2751	302	4855	63

Table 1: Equivalent Population Estimate

Considering the unit breakdown for each building, the total population for the Site is 4,917 persons. This total population is derived from the sum of the total unit population and amenity equivalent population.

As per the Water and Wastewater Master Plan (Region of Peel, 2020), an average daily water demand of 270 L/cap/day, a maximum day factor of 1.8, and a peak hour factor of 3.0 were used to determine the maximum domestic water demand generated by the Site.

The Fire Underwriters Survey method was used to estimate the fire flow demand for the proposed development. This calculation is used to estimate the size of incoming fire lines and does not provide a recommendation for fire protection. The buildings are assumed to have fire-resistive construction and therefore, a construction coefficient of 0.6 was applied to the fire flow calculations (Water Supply for Public Fire Protection by Fire Underwriters Survey, 1999). The proposed residential buildings will be equipped with automatic sprinkler systems which reduces the initial fire flow demand of each building by up to 50%. Each automated sprinkler system is to be designed by the Mechanical Engineer; therefore, the detailed design of the system is not included in this report.

Table 2 below summarizes the estimated design water demand, the required fire flow demand and duration of flow required for each phase. Appendix B contains supporting water demand and fire flow calculations as well as the Region of Peel single use demand table.

Phase Number	Average Daily Demand (L/s)	Maximum Daily Demand (L/s)	Peak Hour Demand (L/s)	Fire Flow (L/s)
Building 1	3.2	5.7	9.5	83
Building 2	2.8	5.1	8.5	83
Building 3	3.0	5.3	8.9	100
Building 4	4.3	7.8	13.0	100
Building 5	2.1	3.8	6.3	83
Total	15.4	27.7	46.1	100

Table 2: Estimated Design Water Demand and Fire Flow

For this application, the domestic water services for the Site will be designed to convey a water demand equivalent to the total peak hourly demand of 46.1 L/s, as shown in Table 2. The overall required fire suppression flow was estimated to be 100 L/s and will be delivered through a system of proposed on-site private hydrants and Siamese connections.

3.3 Proposed Water Servicing

The proposed residential towers (up to 29 storeys) are higher than 84 m and therefore require at least two sources of water from a public water system, per Ontario Building Code (OBC) 3.2.9.7.4.

Two (2) 300 mm diameter fire lines are proposed to service the Site from the existing 300 mm diameter watermain along Highway 50, complete with detector check valves in chambers. A 150 mm diameter domestic line is proposed to branch off of one (1) of the 300 mm diameter fire lines to service the Site. This split in the water service lines will be located 1.2 m from the property line. The Mechanical Engineer will design the internal private water system including the internal sprinkler system within the building and underground parking structure. Preliminary site servicing details can be found on Figure 1.

As per email correspondence from the Region of Peel dated August 6, 2021, it is understood that the existing 300 mm diameter watermain along Highway 50 has sufficient capacity to provide the required domestic and fire flow demand for the Site. Refer to email correspondence provided in Appendix B.

4.0 Sanitary Servicing

The Region of Peel is responsible for the operation and maintenance of the sanitary sewer network in the Town of Caledon. The overall area is serviced by the McVean Trunk System and the G.E. Booth Wastewater Treatment Facility according to the Water and Wastewater Master Plan (Region of Peel, 2020). The existing and proposed sanitary servicing is outlined in the following sections.

4.1 Existing Sanitary Servicing

A review of the Water and Wastewater Master Plan (Region of Peel, 2020) and as-constructed drawings indicate that the following infrastructure exists near the Site:

- Existing 250 mm diameter sanitary sewer on Highway 50 conveys flows south. This sanitary sewer is located on the east side of Highway 50 and crosses to the west side immediate south of the Industrial Road intersection.
- Existing 250 mm diameter sanitary sewer along the south side of Industrial Road conveys flows west. This sanitary sewer merges with the 250 mm diameter sanitary sewer along Highway 50 at an existing sanitary maintenance hole prior to crossing towards the west side of Highway 50.
- Existing 900 mm diameter Albion Vaughan Road sanitary trunk sewer approximately 480 m east of the Site. The 250 mm diameter sanitary sewers ultimately convey sewage south along Highway 50 into the Albion Vaughan trunk sewer, located 1.6 km farther south at its intersection at Mayfield Road.

4.2 Design Sanitary Flow

The sanitary design flow for the subject property was calculated using the Water and Wastewater Master Plan (Region of Peel, 2020) with reference to Public Works Design, Specifications & Procedures Manual – Linear Infrastructure Sanitary Sewer Manual (Region of Peel, March 2017) and the equivalent population estimate described in Section 3.2.

A unit sewage flow of 290 L/cap/d was used with an infiltration flow of 0.26 L/s/ha and a Harmon peaking factor applied to obtain the total estimated design sewage flow. This design sewage flow was estimated in a cumulative manner that mirrors the phasing of each building assuming that Building 1 will be constructed first, until full development with the construction of Building 5. A summary of the results is presented in Table 3 and supporting calculations are provided in Appendix C.

Phase	Cumulative Harmon Peaking Factor	Cumulative Average Daily Flow (L/s)	Cumulative Peak Flow (L/s)	Cumulative Infiltration (L/s)	Cumulative Total Design Flow (L/s)
Building 1	3.80	3.4	12.9	0.18	13.0
Buildings 1-2	3.60	6.4	23.1	0.37	23.5
Buildings 1-3	3.46	9.6	33.2	0.55	33.8
Buildings 1-4	3.31	14.3	47.2	0.73	47.9
Buildings 1-5	3.25	16.5	53.7	0.92	54.6
Total	3.25	16.5	53.7	0.92	54.6

Table 3: Estimated Sanitary Design Flows

The proposed sanitary services for the Site are designed to convey a total design sanitary demand of 54.6 L/s, as shown in Table 3 above.

4.3 Proposed Sanitary Servicing

Sanitary servicing will be provided to the Site through two (2) different 250 mm diameter sanitary laterals. The first sanitary lateral is proposed to be located at the southwest corner of Building 1. This lateral will connect to a sanitary maintenance hole at the property line, extending from the existing 250 mm diameter sanitary sewer on Highway 50.

As per email correspondence from the Region of Peel dated August 6, 2021, it is understood that the existing 250 mm diameter sanitary sewer on Highway 50 does not have sufficient capacity to service the complete Site.

It is also understood that there are no planned upgrades to this sanitary sewer. Moreover, the Region recommends that a new sanitary sewer be constructed to connect the proposed development to the existing Albion Vaughan trunk sewer, located within Albion Vaughan Road.

It is anticipated that the new sewer would follow the alignment of Industrial Road and the future George Bolton Parkway Extension. Details pertaining to the design and construction of the new sanitary sewer connection to the Albion Vaughan trunk sewer are being determined in coordination with the Region and Town.

Based on the foregoing, it is proposed to connect the first phase(s) to the existing 250 mm diameter sanitary sewer on Highway 50 until the residual capacity is utilized. During the timeline of this construction, it is anticipated that the new sanitary sewer will be constructed.

Once construction of the new sanitary sewer is complete, all future phases will connect into the new sanitary sewer. As such, a second lateral is proposed to be located along the east side of Building 3. This lateral will connect to a sanitary maintenance hole at the property line, extending from the new sanitary sewer within Industrial Road.

Details pertaining to the phasing and connection locations is subject to the ongoing coordination with the Region and Town.

The internal sanitary system of the buildings will be designed according to the Mechanical Engineer's details and specifications and sanitary servicing for each building will be conveyed through the underground mechanical system. Preliminary site servicing details are provided on Figure 1.

5.0 Drainage Conditions

As described in Section 2.0, the subject property currently consists of various paved and unpaved commercial lands. The following subsections detail the existing and proposed drainage conditions for the Site.

5.1 Existing Drainage Conditions

According to the topographic plan provided by ERTL Surveyors, the Site generally drains south in two (2) Catchments towards Industrial Road and Highway 50. Please refer to Figure 3 for the Pre-Development Drainage Plan.

Table 4 below summarizes the existing drainage from Catchment 101 (Highway 50) and Catchment 102 (Industrial Road).

Table 4, Tre-Development Land Areas and Konon Coencients					
Catchment	ment Area (Ha) Runoff Coefficient				
Drainage to Highway 50					
101	1.28	0.50			
Drainage to Industrial Road					
102	2.24	0.50			
Total	3.52				

Table 4: Pre-Development Land Areas and Runoff Coefficients

Stormwater runoff from the southwest portion of the Site (Catchment 101) drains via overland flow towards an existing ditch along Highway 50. The stormwater runoff from the north and east portions of the Site (Catchment 102) drains via overland flow towards an existing ditch along Industrial Road, which subsequently connects into the existing ditch along Highway 50. Both areas of the Site are ultimately conveyed to the existing stormwater management pond located at the southeast corner of Highway 50 and George Bolton Parkway. A small external area (EX1 – 0.014 ha) drains south towards the Site, via overland toward, to an existing ditch located along the north property line. The existing ditch conveys collected runoff eastward, toward the Industrial Road ditch, where is combines with drainage form Catchment 101.

5.2 Proposed Drainage Conditions

The post-development drainage is divided into two (2) controlled drainage areas and four (4) uncontrolled drainage areas, based on proposed grading.

Drainage to Highway 50

- Catchment 201 (1.30 ha): This Catchment predominantly includes the surface areas and surrounding road, landscaped area, and parking spaces for Building 1 and Building 5, where major overland flow is directed south towards Highway 50.
- Catchment UC1 (0.015 ha) and Catchment UC2 (0.015 ha): These hardscaped and landscaped areas outside of Buildings 1 and 5 are proposed to drain uncontrolled to Highway 50 as clean and slow-flowing discharge.

Drainage to Industrial Road

- Catchment 202 (2.09 ha): This Catchment predominantly includes the surface areas and surrounding road, landscaped area, and parking spaces for Building 2, Building 3, and Building 4, where major overland flow is directed east towards Industrial Road.
- Catchment UC3 (0.043 ha) and Catchment UC4 (0.05 ha): These hardscaped and landscaped areas outside of Building 2 and Building 3 are proposed to drain uncontrolled toward Industrial Road.
- Catchment EX1 (0.014 ha): This Catchment consists of external drainage, as described in Section 5.1. Drainage will continue to be directed toward Industrial Road under post-development conditions.

Table 5 provides a breakdown of post-development site areas and associated runoff coefficients. Please refer to Figure 4 for the Post-Development Drainage Plan.

Catchment	Area (Ha)	Runoff Coefficient				
	Drainage to I	Highway 50				
201	1.30	0.90				
UC1	0.02	0.88				
UC2	0.02	0.87				
	Drainage to In	dustrial Road				
202	2.09	0.90				
UC3	0.04	0.68				
UC4	0.05	0.73				
Total	3.52					

Minor and Major System Drainage

Minor and Major system flows from Catchments 201 and 202 will be collected via area drains and rooftops. The collected drainage is proposed to be conveyed through internal underground storm sewer systems, designed in accordance with the Mechanical Engineer's design and specifications, to underground stormwater storage tanks located within the respective Catchment areas.

Additional details pertaining to the underground storage tanks and proposed stormwater management (SWM) plan for the Site are provided in Section 6.0 below

All proposed area drains will be designed to capture flow from the 100-year design storm event. At the detailed design phase, inlet capacity calculations for the proposed area drains will be provided. These calculations are to be completed assuming that the area drain grates are blocked by debris and are operating at 50% capacity.

Proposed site grading has been completed to ensure that emergency flows for Catchment 201 and Catchment 202 will be directed towards Highway 50 and Industrial Road, respectively. Preliminary site grading is provided on Figure 2.

6.0 Stormwater Management

The stormwater management criteria for the Site involves controlling the stormwater runoff from the development in accordance with standards set by the Region of Peel, Town of Caledon and Toronto and Region Conservation Authority, and are summarized as follows:

- Water Quantity Control: Control post-development peak flow to pre-development peak flow for all storm events up to the 100-year event, using a pre-development maximum runoff coefficient of 0.50.
- Water Quality Control: 80% Total Suspended Solids (TSS) removal on annual loading basis of the stormwater runoff leaving the development in accordance with Enhanced Water Quality Control Criteria (MECP, 2003).

Water Balance: Retain runoff from a small design rainfall event (typically 5 mm) on-site through evaporation or rainwater reuse.

6.1 Stormwater Quantity Control

As outlined in Section 5.0, the existing site drainage is split between two outlets. The following sections outline the stormwater quantity control requirements for each outlet.

Highway 50 Outlet 6.1.1

As outlined in Section 6.0 the Site is required to control post-development peak flows to pre-development levels for all storm events up to the 100-year event. For drainage to Highway 50, pre-development flows are generated by Catchment 101.

Calculations were completed using Town of Caledon intensity-duration-frequency (IDF) data, and a runoff coefficient of 0.50, as mentioned in Section 5.1. The pre-development peak flows generated by Catchment 101 draining to Highway 50 are outlined in Table 6. Supporting calculations are provided in Appendix D.

Table 6: Summary of Pre-development Peak Flows – Highway 50							
Catabasant ID	Pre-development (L/s)						
Catchment ID	2 yr	5 yr	10 yr	25 yr	50 yr	100 yr	
101	153.0	195.8	239.5	279.3	314.5	350.8	

Table 4: Summary of Pre-development Peak Flows - Highway 50

The peak flows presented in Table 6 have been taken as target rates for stormwater quantity control for drainage to Highway 50.

The Rational Method has also been used to determine the post-development peak flows generated by the catchments draining to Highway 50 in an uncontrolled condition. These catchments include Catchments 201, UC1 and UC2, as indicated in Section 5.2. Results are presented in Table 7 along with a comparison to the target flows, and supporting calculations are provided in Appendix D.

Post-development Difference **Total Flow** Relative to Qpost-201 Qpost-UC1 Qpost-UC2 **Return Period** (L/s) (L/s) (L/s) (L/s) **Target Flows** ((L/s) 2 yr 280.8 3.2 3.1 287.1 +134.1 5 yr 359.3 4.1 4.0 367.4 +171.6 5.0 4.9 449.4 439.5 +209.9 10 yr 512.6 25 yr 5.8 5.7 524.1 +244.8 50 yr 577.2 6.5 6.5 590.2 +275.7

7.2

Table 7: Summary of Post-Development Peak Flows (Uncontrolled to Highway 50)

Note: Difference Relative Target Flows = Total Flow - Target Flows

643.9

As presented in Table 7, the post-development peak flows generated by the proposed development draining to Highway 50 exceed the target flows. Therefore, stormwater quantity controls are required for this outlet.

7.3

The Modified Rational Method was used to determine the required stormwater quantity control for the post-development catchments draining to Highway 50. As outlined in Section 5.2, stormwater runoff from Catchment 201 will be captured and controlled within an underground storage tank located within the underground parking, prior to discharging to Highway 50.

100 yr

+307.5

658.3

Furthermore, stormwater runoff from Catchments UC1 and UC2 will drain uncontrolled. Therefore, stormwater quantity controls within Catchment 201 must be overcontrolled to account for the uncontrolled runoff. It has been assumed that the stormwater captured within the underground storage tank will require a pump to discharge the captured runoff to the receiving storm sewer. Details pertaining to the pump will be designed according to the Mechanical Engineer's details and specifications. For the purposes of this report a pump rate of 50.0 L/s has been assumed.

A summary of the controlled flows to Highway 50 is presented in Table 8 along with relative differences to the target flows. Supporting calculations are provided in Appendix D.

Iur	Table 8. Sommary of rost-Development reak nows (Commoned to highway 50)							
Return		Post-de	Difference Relative to Target Flows (m ³ /s)					
Period	Qpost-201 (L/s)	Qpost-UC1 (L/s)	Qpost-UC2 (L/S)	Total Flow (m³/s)				
2 yr	50.0	3.2	3.1	56.3	-96.7			
5 yr	50.0	4.1	4.0	58.1	-137.7			
10 yr	50.0	5.0	4.9	59.9	-179.6			
25 yr	50.0	5.8	5.7	61.5	-217.8			
50 yr	50.0	6.5	6.5	63.0	-251.5			
100 yr	50.0	7.3	7.2	64.5	-286.3			

Table 8: Summary of Post-Development Peak Flows (Controlled to Highway 50)

Note: Difference Relative Target Flows = Total Flow - Target

As demonstrated by Table 8, the total post-development peak flows in a controlled condition are lower than the target flows, satisfying the water quantity control criteria. The required stormwater quantity control volumes are presented in Table 9.

	Table 9: Storage Summary – Highway 50
Dotum Dovio d	Required Active Storage
Return Period	201 (m ³)
2 yr	171.9
5 yr	275.4
10 yr	364.9
25 yr	482.0
50 yr	570.4
100 yr	667.1

As demonstrated in Table 9, a total of 667.1 m³ of onsite storage is required to provide the requisite water quantity control for drainage to Highway 50. Supporting calculations are provided in Appendix D.

Details pertaining the underground stormwater storage tank and required pump will be determined at detailed design stage.

6.1.2 Industrial Road Outlet

As outlined in Section 6.0 the Site is required to control post-development peak flows to predevelopment levels for all storm events up to the 100-year event. For drainage to Industrial Road, pre-development flows are generated by Catchment 102.

Calculations were completed using Town of Caledon IDF data, and a runoff coefficient of 0.50, as mentioned in Section 5.1. The pre-development peak flows generated by Catchment 102 draining to Industrial Road are outlined in Table 10. Supporting calculations are provided in Appendix D.

Pre-development (L/s) **Catchment ID** 50 yr 2 yr 10 yr 25 yr 100 yr 5 yr 102 268.6 343.6 420.4 490.3 552.0 615.8

Table 10: Summary of Pre-development Peak Flows – Industrial Road

The peak flows presented in Table 10 have been taken as target rates for stormwater quantity control for drainage to Industrial Road

The Rational Method has also been used to determine the post-development peak flows generated by the catchments draining to Industrial Road in an uncontrolled condition. These catchments include Catchments 202, UC3 and UC24 as indicated in Section 5.2. Results are presented in Table 11 along with a comparison to the target flows, and supporting calculations are provided in Appendix D.

Table 11: Summary of Post-Development Peak Flows (Uncontrolled to Industrial Road)

		Difference			
Return Period	Q post-202 (L/S)	Qpost-UC3 (L/S)	Qpost-UC4 (L/S)	Total Flow (L/s)	Relative to Target Flows ((L/s)
2 yr	451.5	7.0	8.8	467.2	+198.7
5 yr	577.6	9.0	11.2	597.8	+254.2
10 yr	706.6	11.0	13.7	731.3	+310.9
25 yr	824.1	12.8	16.0	852.9	+362.6
50 yr	928.0	14.4	18.0	960.4	+408.4
100 yr	1035.1	16.1	20.1	1071.3	+455.5

Note: Difference Relative Target Flows = Total Flow - Target Flows

As presented in Table 11, the post-development peak flows generated by the proposed development draining to Industrial Road exceed the target flows. Therefore, stormwater quantity controls are required for this outlet.

The Modified Rational Method was used to determine the required stormwater quantity control for the post-development catchments draining to Industrial Road. As outlined in Section 5.2, stormwater runoff from Catchment 202 will be captured and controlled within an underground storage tank located within the underground parking, prior to discharging to Industrial Road. Furthermore, stormwater runoff from Catchments UC3 and UC4 will drain uncontrolled. Therefore, stormwater guantity controls within Catchment 202 must be overcontrolled to account for the uncontrolled runoff. It has been assumed that the stormwater captured within the underground storage tank will require a pump to discharge the captured runoff to the receiving storm sewer. Details pertaining to the pump will be designed according to the Mechanical Engineer's details and specifications. For the purposes of this report a pump rate of 50.0 L/s has been assumed.

A summary of the controlled flows to Industrial Road is presented in Table 12 along with relative differences to the target flows. Supporting calculations are provided in Appendix D.

Table	Table 12: Summary of Post-Development Peak Flows (Controlled to Industrial Road)									
Return		Post-de	Difference Relative to Target Flows (m ³ /s)							
Period	Qpost-202 (L/S)	Q post-UC3 (L/s)	Qpost-UC4 (L/s)	Total Flow (L/s)						
2 yr	50.0	7.0	8.8	65.8	-202.8					
5 yr	50.0	9.0	11.2	70.2	-273.5					
10 yr	50.0	11.0	13.7	74.7	-345.7					
25 yr	50.0	12.8	16.0	78.8	-411.5					
50 yr	50.0	14.4	18.0	82.4	-469.6					
100 yr	50.0	16.1	20.1	86.2	-529.6					

Note: Difference Relative Target Flows = Total Flow - Target

As demonstrated by Table 12, the total post-development peak flows in a controlled condition are lower than the target flows, satisfying the water quantity control criteria. The required stormwater quantity control volumes are presented in Table 13.

Table 13: Storage	Summary – Industrial Road

	Required Active Storage
Return Period	202 (m ³)
2 yr	171.9
5 yr	532.8
10 yr	686.8
25 yr	897.6
50 yr	1049.7
100 yr	1215.5

As demonstrated in Table 13, a total of 1215.5 m³ of onsite storage is required to provide the requisite water quantity control for drainage to Industrial Road. Supporting calculations are provided in Appendix D.

Details pertaining the underground stormwater storage tank and required pump will be determined at detailed design stage.

6.2 **Stormwater Quality Control**

As outlined in Section 6.0, stormwater quality controls for the proposed development must incorporate measures to provide an Enhanced Level of Protection (Level 1). In accordance with the MOECC (March 2003) guidelines, enhanced water quality protection involves the removal of at least 80% of the total suspended solids (TSS) from 90% of the annual runoff volume.

For Catchments 201 and 202, the treatment train approach is proposed to achieve the requisite guality control. The treatment train includes catchbasin shields and oil-grit-separators (OGS). Catchbasin shields are proposed within the catchbasins located in the asphalt parking lot, upstream of the proposed underground storage tanks.

OGS units are proposed downstream of both underground storage tanks. OGS sizing will be provided at the detailed design stage.

Catchments UC1 – UC4 consists of impervious walkways draining overland to pervious grassed areas. Runoff form these catchments is considered to be clean, however should there be any TSS loading from the impervious areas, the pervious grassed areas would provide the requisite water quality control.

6.3 Water Balance

As outlined in Section 6.0, runoff from the 5 mm storm event must be retained on site. The requisite water balance retention volume was calculated considering initial abstraction of runoff based on impervious areas of the proposed development.

The Site has a total of 3.15ha of impervious area. As such, a volume of 126 m³ is required to be retained onsite in order to achieve the water balance criteria. Supporting calculations are provided in Appendix D

The storage will be provided via dead storage in the proposed underground storage tanks, which will be reused throughout the proposed development as grey water, or for irrigation purposes. The requisite water balance volume has been split between the two underground stormwater tanks based on the post-development drainage areas to Highway 50 and Industrial Road.

As such, 48.0 m³ of dead storage is proposed within the underground storage tank located within Catchment 201, and 77.9 m³ is proposed within the underground storage tank located within Catchment 202.

Once the final plan area of the underground stormwater tanks has been established during detailed design, the dead storage details will be determined.

Runoff from Catchments flowing uncontrolled in the post-development condition (UC1, UC2, UC3, and UC4) will not be captured, and therefore cannot be retained on-site. However, the storage volume provided within the underground stormwater tanks will compensate for the uncontrolled catchments.

7.0 Conclusions and Recommendations

The proposed developments can be serviced for water, sanitary, and stormwater in accordance with the Town of Caledon and Region of Peel requirements and standards. Our conclusions and recommendations include:

- 1. The equivalent population of the proposed development of five (5) multi-storey residential buildings was estimated to be approximately 4,917 persons.
- Water servicing will be provided through redundant 300 mm diameter fire services and a 150 mm diameter domestic water service. The water servicing will extend from the existing 300 mm diameter watermain on Highway 50 to the limit of the underground parking garage. The internal water system, designed in accordance with Mechanical details and specifications, will provide water servicing for each building.

- 3. Sanitary servicing will be provided through two (2) 250 mm diameter sanitary laterals, one (1) extending from the existing 250 mm diameter sanitary sewer on Highway 50, and one (1) extending from a future sanitary sewer within Industrial Road, connecting to the Albion Vaughan trunk sewer. The design of the new Industrial Road sewer is currently on-going. The phasing of the sanitary connections for the Site will be determined as the design of the new Industrial Road sewer network, designed in accordance with Mechanical details and specifications, will provide sanitary servicing for each building.
- 4. Stormwater quantity control will be provided via underground stormwater storage tanks and peak flow control.
- 5. Stormwater quality control will be provided via catchbasin shields and oil/grit separators (OGS) sized to provide an enhanced level of protection (80% TSS removal).
- 6. Water balance will be provided as dead storage within the proposed underground stormwater storage tanks, which will be re-used throughout the proposed development as grey water, or for irrigation purposes.

We trust that this review satisfies any concerns associated with the proposed development. Please feel free to contact the undersigned for any further information required.

Respectfully submitted,

GENERAL NOTES

MEASUREMENTS

ALL DIMENSIONS ARE IN METERS, EXCEPT PIPE DIAMETERS WHICH ARE IN MILLIMETRES, UNLESS OTHERWISE SPECIFIED.

GENERAL

- 1. ALL WORK SHALL BE IN ACCORDANCE WITH CURRENT TOWN OF CALEDON DEVELOPMENT STANDARDS.
- 2. ALL UNDERGROUND SERVICE MATERIALS AND INSTALLATIONS TO BE IN ACCORDANCE WITH THE LATEST STANDARDS AND CODES.
- 3. ORDER OF PRECEDENCE OF STANDARD DRAWINGS IS FIRSTLY TOWN OF CALEDON DEVELOPMENT STANDARDS, SECONDLY REGION OF PEEL STANDARD DRAWINGS, AND THIRDLY ONTARIO PROVINCIAL STANDARD DRAWINGS (OPSD).
- 4. LOCATION OF EXISTING SERVICES AND UTILITIES ARE NOT GUARANTEED. THE CONTRACTOR SHALL BE RESPONSIBLE FOR LOCATING AND MAINTAINING EXISTING UTILITIES. ANY CHANGES SHALL BE REPAIRED AT THE CONTRACTORS COST TO THE SATISFACTION OF THE APPROPRIATE UTILITY.
- 5. CONTRACTOR SHALL BE RESPONSIBLE FOR CONFIRMING WITH OWNER AND OR ARCHITECT THE LOCATION OF WATER AND SANITARY SERVICE CONNECTIONS.
- 6. THE BUILDING SITED ON THIS PLAN HAS BEEN DESIGNED UTILIZING CONTROLLED FLOW ROOF DRAINS IN ACCORDANCE WITH LOCAL MUNICIPAL STANDARDS.
- 7. NATIVE AND GRANULAR MATERIAL, SUITABLE FOR BACKFILL, SHALL BE COMPACTED TO A MIN. 95% SPDD EXCEPT TOP 0.3m WHICH MUST BE COMPACTED TO 98% SPDD, OR AS RECOMMENDED BY A QUALIFIED SOILS CONSULTANT.
- 8. MATCH EX. GRADES AT PROPERTY LINES.
- 9. ROAD OCCUPANCY PERMIT MUST BE OBTAINED 48 HOURS PRIOR TO COMMENCING ANY WORKS WITHIN THE MUNICIPAL ROAD ALLOWANCE.

SANITARY AND STORM SEWERS

- 1. ALL CONCRETE AND PLASTIC PIPE SHALL HAVE RUBBER GASKET JOINTS.
- 2. ALL SEWERS SHALL BE CONSTRUCTED WITH BEDDING IN ACCORDANCE WITH OPSD 802.03 CLASS "B" UNLESS OTHERWISE NOTED.
- 3. PLASTIC STORM SEWER PIPE SHALL BE CONSTRUCTED WITH ULTRA RIB OR APPROVED EQUAL UP TO THE MAXIMUM DIAMETER OF 600mm.
- 4. ALL CATCH BASIN MANHOLES TO HAVE A MINIMUM 0.3 METRE SUMP AND TOP AS PER MUNICIPAL STANDARDS.
- 5. SAN. SEWER PIPE TO BE PVC SDR 35 AND SHALL CONFORM TO C.S.A.-B-182.2,3,4.
- 6. SAN. MANHOLES SHALL BE INSTALLED IN ACCORDANCE WITH REGION OF PEEL STANDARD DRAWINGS 2-1-1 TO 2-1-6 AND 2-2-1 TO 2-2-4. MANHOLE COVERS TO HAVE THE WORD "SANITARY" CAST INTO THE COVER WITH 50mm LETTERS. STANDARD HEAVY DUTY FRAME AND COVER TO BE INSTALLED UNLESS OTHERWISE SPECIFIED.
- WATERMAINS
- 1. ALL WATERMAINS AND WATER SERVICE MATERIALS AND CONSTRUCTION METHODS MUST CORRESPOND TO THE CURRENT REGION OF PEEL PUBLIC WORKS STANDARDS AND SPECIFICATIONS
- 2. WATERMAINS AND/OR WATER SERVICE MATERIALS 100mm (4") AND LARGER MUST BE P.V.C. CLASS 150, MFG. TO A.W.W.A. SPEC. C900-75. SIZES 50mm (2") AND SMALLER, TO BE POLYETHYLENE PIPE 2306 TUBE SERIES 160 IN ACCORDANCE WITH C.S.A. B.137.1 -1970, A.W.W.A. SPEC. C901-78 IN SIZES 20 TO 50mm (1" TO 2").
- 3. WATERMAINS AND/OR WATER SERVICES ARE TO HAVE A MINIMUM COVER OF 1.7m (5'-6") WITH A MINIMUM HORIZONTAL SPACING OF 1.2m (4'-0") FROM THEMSELVES AND ALL OTHER UTILITIES.
- 4. ALL CURB STOPS TO BE 3.0m (10') OFF THE FACE OF THE BUILDING UNLESS NOTED OTHERWISE.
- 5. WATERMAINS TO BE INSTALLED TO GRADES AS SHOWN ON APPROVED COPY OF GRADE SHEET WHICH MUST BE SUPPLIED TO INSPECTOR PRIOR TO COMMENCEMENT OF WORK WHERE REQUESTED BY THE INSPECTOR. GRADE SHEET TO SPECIFY GRADE OF WATERMAIN, THE FINISHED GRADE OVER THE WATERMAIN AT INTERVALS OF AT LEAST 15 metres AND THE ELEVATIONS AT POINTS OF CROSSING OF THE WATERMAIN AND AND WATER SERVICES WITH OTHER UTILITIES AND DITCHES
- 6. WATERMAINS MUST HAVE & MINIMUM VERTICAL CLEARANCE OF .15m (6") OVER AND .3m (12") UNDER SEWERS AND ALL OTHER UTILITIES WHEN
- 7. PROVISIONS FOR FLUSHING WATER LINES PRIOR TO TESTING MUST BE PROVIDED WITH AT LEAST A 50mm (2") OUTLET ON 100mm (4") AND LARGER LINES.
- 8. ALL PROPOSED WATERMAIN PIPING MUST BE ISOLATED FROM EXISTING LINES IN ORDER TO ALLOW INDEPENDENT PRESSURE TESTING AND CHLORINATING EXISTING SYSTEM.

ROAD WORKS

1. DRIVEWAY GRANULAR BASE AND SUB-BASE TO BE CONSTRUCTED OF THE FOLLOWING: - 150mm GRANULAR 'A' - 300mm GRANULAR 'B'

- THE GRANULAR BASE AND SUB-BASE MATERIALS SHOULD CONFORM TO OPSS GRADATION SPECIFICATIONS AND SHOULD BE COMPACTED TO 100% STANDARD PROCTOR MAXIMUM DRY DENSITY (SPMDD).
- 2. UPON COMPLETION OF THE INSTALLATION OF GRANULAR MATERIALS, ELEVATIONS SHOULD BE CHECKED TO ENSURE WORKS CORRESPOND TO THE APPROVED GRADING DESIGN.
- 3. SUB-GRADE TO BE PROOF ROLLED PRIOR TO INSTALLATION OF GRANULAR SUB-BASE MATERIALS. SOFT SPOTS TO BE REMOVED AND FILLED WITH GRANULAR 'B' AND COMPACTED TO 95% SPMDD.
- 4. DRIVEWAY ENTRANCE TO BE PAVED FROM EDGE OF EX. PAVEMENT TO STREET LINE WITH 40mm HL3 AND 110mm HL8. SITE DRIVEWAYS AND PARKING AREAS TO BE PAVED WITH 40mm HL3 AND 65mm HL8.
- 5. CONCRETE CURB SHALL BE IN ACCORDANCE WITH OPSD 600.11.

Connection Demand Table

12563 & 12599 Highway 50 & 2 Industrial Road, Town of Caledon

WATER CONNECTION

Connection point ³⁾ Existing 300	mm diameter v	watermain on Highwa	ay 50
Pressure zone of connection poi	Zone 6		
Total equivalent population to be	4917 persons		
Total lands to be serviced		3.52 ha	
Hydrant flow test			
Hyd	rant flow test lo	cation	
Test #1 – 1	2566 Highway	50, Caledon	
	Pressure (kPa)	Flow (in l/s)	Time
Minimum water pressure	68.95	461.06	
Maximum water pressure	137.90	506.17	
Hyd	rant flow test lo	cation	
Test #2 –	2 Industrial Dri	ve, Caledon	
Minimum water pressure	68.95	454.18	
Maximum water pressure	137.90	497.78	

No.	Proposed Water Demands									
NO.	Demand type	Demand	Units							
1	Average day flow	15.4	l/s							
2	Maximum day flow	27.7	l/s							
3	Peak hour flow	46.1	l/s							
4	Fire flow ²⁾	100	l/s							
Anal	Analysis									
5	Maximum day plus fire flow	127.7	l/s							

WASTEWATER CONNECTION

Conr	lection point ⁴⁾	Existing 250 mm diameter sanitary sewer on Highway 50			
Total	equivalent population to be serviced	4917			
Total	lands to be serviced	3.52 ha			
6	Wastewater sewer effluent (in I/s)	54.6			

¹⁾ Please refer to design criteria for population equivalencies

²⁾ Please reference the Fire Underwriters Survey Document
 ³⁾ Please specify the connection point ID

⁴⁾ Please specify the connection point (wastewater line or manhole ID) Also, the "total equivalent population to be serviced" and the "total lands to be serviced" should reference the connection point. (the FSR should contain one copy of Site Servicing Plan)

Please include the graphs associated with the hydrant flow test information table Please provide Professional Engineer's signature and stamp on the demand table All required calculations must be submitted with the demand table submission.

Mark DiConstanzo 12599 Hwy 50 Ltd. 91 Parr Boulevard Bolton, Ontario L7E 4E3

November 9th, 2020

RE: Fire Flow Testing Hwy 50 and Industrial Road, Bolton, ON

Watermark has conducted two fire flow tests near the intersection of Highway 50 and Industrial Road, Town of Bolton, Caledon. The testing was completing in accordance with NFPA 291. Region of Peelwater operations staff were on hand to assist.

Test #1 - 12566 Highway 50

Static pressure prior to the test was observed to be 73 PSI. Using 2 x 2.5" ports on one flow hydrant, and 1 x 4" port on a second flow hydrant, a maximum flow rate of 3050 USGPM was achieved. This provided an 14% pressure drop, to 62.5 PSI.

Test #2 - 2 Industral Road

Static pressure prior to the test was observed to be 74 PSI. Using 2 x 2.5" ports on one flow hydrant, and 1 x 4" port on a second flow hydrant, a maximum flow rate of 3050 USGPM was achieved. This provided an 15% pressure drop, to 63 PSI.

Althought the minimum required pressure drop was not acheived (25% of static), the high flow rate acheived provides increased confidence in the projected flow rates and subsequent ratings.

Equipment:

Flow: 1 x 4" HoseMonster with integrated 4" Pitotless Nozzle Flow: 2 x 2.5" HoseMonster with integrated 2" Pitotless Nozzle Pressure: HYDREKA Octopus LX Data Logger w/ 20 bar integrated pressure sensor We strongly feel that all attempts have been made to ensure that the required data as stipulated will be captured, stored and presented in an accurate, efficient and timely manner for the required period. We are pleased Watermark again as your data provider, and we look forward to working with you in the future.

Kind Regards,

Colin Powell

Comments/Discrepencies/Diagram:

Hello,

I do not have the contact information for the engineering consultants, please forward this email accordingly.

I have received and reviewed the FSR provided by Crozier & Associated Inc., dated February 2021. Based on the proposed development, the Region has capacity to service the proposed water demands.

However, the Region cannot service the proposed flows of 53.09 L/s from the proposed development into the 250mm sanitary sewer in Highway 50. The 900mm trunk sewer is able to service the proposed development via a new 250mm sewer along Industrial Road, which is to be constructed by the developer.

There are no new or future planned upgrades for the existing sanitary sewer within Highway 50 by the Region.

Please let me know if you would like to arrange a time to discuss this in further detail.

Regards, Camila Marczuk

Technical Analyst, Servicing Connections Development Services, Public Works, Region of Peel 10 Peel Centre Drive, Suite B, 4th Floor Brampton, On L6T 4B9
